$\log (P/mmHg) = 13.95 - 7260/(T/K)$; temp range $110-180^{\circ}C$ (Knudsen effusion method, Hoyer & Peperle 1958)

5.31×10^{-9} (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_s/kPa) = 13.075 - 7260/(T/K)$; temp range $383-453\ K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_s/kPa) = 12.9379 - 7210/(T/K)$; temp range $383-516\ K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

7.00×10^{-7} (quoted, Riederer 1990)

$1.84 \times 10^{-8*}$ (gas saturation, extrapolated-Antoine eq. derived from exptl. data, temp range $118-210^{\circ}C$, Oja & Suuberg 1998)

$\ln (P/Pa) = 35.702 - 15955/(T/K)$; temp range $391-424\ K$ (Clausius-Clapeyron eq., Knudsen effusion, Oja & Suuberg 1998)

1.40×10^{-8} ; 5.22×10^{-6} (quoted solid P_s from Mackay et al. 1992; converted to supercooled liquid P_L with fugacity ratio F , Passivirta et al. 1999)

$\log (P_s/Pa) = 12.53 - 6074/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.53 - 4414/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

4.88×10^{-6} (supercooled liquid P_L , calibrated GC-RT correlation, Lei et al. 2002)

$\log (P_L/Pa) = -4694/(T/K) + 10.43$; $\Delta H_{vap} = -89.9 \text{ kJ}\cdot\text{mol}^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C and the report temperature dependence equations):

0.440 (calculated-P/C, Riederer 1990)

$\log [H/(\text{Pa m}^3/\text{mol})] = 9.84 - 2752/(T/K)$, (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.30, 5.10 (HPLC-RV predicted, Brooke et al. 1986)

5.30 (HPLC-RV measured, Brooke et al. 1986)

5.82 (HPLC-RT correlation, Wang et al. 1986)

6.25 (recommended, Sangster 1989, 1994)

6.40 (Bayona et al. 1991)

5.82 (recommended, Hansch et al. 1995)

6.50 (shake flask-dialysis tubing-HPLC/UV, both phases, Andersson & Schröder 1999)

6.25; 6.53 (quoted lit.; calculated, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.86, 3.73 (*Daphnia pulex*, kinetic estimation, Southworth et al. 1978)

4.36 (activated sludge, Freitag et al. 1984)

3.30, 4.36, < 1.0 (algae, activated sludge, fish, Klein et al. 1984)

3.85 (*Daphnia pulex*, correlated as per Mackay & Hughes 1984, Hawker & Connell 1986)

3.30, 4.36, < 1.0 (algae, activated sludge, fish, Freitag et al. 1985)

3.86 (*Daphnia magna*, Newsted & Giesy 1987)

1.196, -0.398 (*Polychaete sp.*, *Capitella capitata*, Bayona et al. 1991)

Sorption Partition Coefficient, $\log K_{oc}$ at 25°C or as indicated:

6.39–7.93 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
5.88; 6.73, 6.63, 6.76 (20°C , batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

6.30; 5.89; 4.15–6.38 (calculated- K_{ow} ; calculated-solubility; quoted lit. range, Schlautman & Morgan 1993a)

6.05 at pH 4, 5.98 at pH 7, 5.71 at pH 10 in 0.001 M NaCl; 6.01 at pH 4, 5.95 at pH 7, 5.29 at pH 10 in 0.01 M NaCl; 5.98 at pH 4, 5.67 at pH 7, 4.86 at pH 10 in 0.1 M NaCl; 5.97 at pH 4, 5.61 at pH 7, 4.78 at pH 10 in 1 mM Ca^{2+} in 0.1 M total ionic strength solutions (shake flask/fluorescence, dissolved humic substances-humic acid; Schlautman & Morgan 1993)

5.17 at pH 4 in 0.001 M NaCl; 5.14 at pH 4 in 0.01 M NaCl; 5.08 at pH 4 in 0.1 M NaCl; 5.11 at pH 4 in 1 mM Ca^{2+} in 0.1 M total ionic strength solutions (shake flask/fluorescence, dissolved humic substances-fulvic acid; Schlautman & Morgan 1993a, b)

5.82 at pH 4, < 4.49 at pH 7, < 4.18 at pH 10 in 0.001 M NaCl; 5.65 at pH 4, < 4.46 at pH 7, < 3.85 at pH 10 in 0.01 M NaCl; 5.67 at pH 4, < 4.17 at pH 7, < 3.78 at pH 10 in 0.1 M NaCl; 5.74 at pH 4, 5.02 at pH 7, 4.43 at pH 10 in 1 mM Ca^{2+} in 0.1 M total ionic strength solutions (shake flask/fluorescence, adsorbed humic substances-humic acid; Schlautman & Morgan 1993b)

< 3.48 at pH 4 in 0.001 M NaCl; < 3.30 at pH 4 in 0.01 M NaCl; < 3.48 at pH 4 in 0.1 M NaCl; < 3.48 at pH 4 in 1 mM Ca^{2+} in 0.1 M total ionic strength solutions (shake flask/fluorescence, adsorbed humic substances-fulvic acid; Schlautman & Morgan 1993b)

6.00 (soil humic acid, shake flask-HPLC/UV, Cho et al. 2002)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: sublimation $k < 1 \times 10^{-5} \text{ s}^{-1}$ from glass surface was measured at 24°C at an airflow rate of 3 L/min (Cope & Kalkwarf 1987).

Photolysis:

half-lives on different atmospheric particulate substrates (appr. 25 $\mu\text{g/g}$ on substrate): $t_{1/2} = 3.9 \text{ h}$ on silica gel, $t_{1/2} = 1.2 \text{ h}$ on alumina and $t_{1/2} = 35 \text{ h}$ on fly ash (Behymer & Hites 1985)

ozonation $k < 4.7 \times 10^{-5} \text{ m/s}$ was measured from glass surface at 24°C with $[\text{O}_3] = 0.16 \text{ ppm}$ and light intensity of 1.3 kW/m^2 (Cope & Kalkwarf 1987)

photodegradation $k = 0.0152 \text{ min}^{-1}$ and $t_{1/2} = 0.78 \text{ h}$ in ethanol-water (2:3, v/v) solution for initial concentration of 5.0 ppm by high pressure mercury lamp or sunlight (Wang et al. 1991)

$k(\text{expt}) = 0.0152 \text{ min}^{-1}$ the pseudo-first-order rate constant with the calculated $t_{1/2} = 0.78 \text{ h}$ and the predicted $k = 0.0406 \text{ min}^{-1}$, calculated by QSPR in aqueous solution when irradiated with a 500 W medium pressure mercury lamp (Chen et al. 1996);

$t_{1/2} = 0.53 \text{ h}$ (predicted- QSPR) in atmospheric aerosol (Chen et al. 2001)

Photodegradation $k = 4.4 \times 10^{-4} \text{ s}^{-1}$ in surface water during the summertime at mid-latitude (Fasnacht & Blough 2002)

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 752 \text{ h}^{-1}$; $k_2 = 0.139 \text{ h}^{-1}$ (*Daphnia pulex*, Southworth et al. 1978)

$\log k_1 = 2.88 \text{ h}^{-1}$; $\log k_2 = -0.86 \text{ h}^{-1}$ (*Daphnia pulex*, correlated as per Mackay & Hughes 1984, Hawker & Connell 1986)

$k_1 = 0.12\text{--}0.38 \text{ mg g}^{-1} \text{ h}^{-1}$; $k_2 = 0.0034 \text{ h}^{-1}$ (freshwater oligochaete from sediment, Van Hoof et al. 2001)

Half-Lives in the Environment:

Air: direct photolysis $t_{1/2} = 0.53 \text{ h}$ (predicted- QSPR) in atmospheric aerosol (Chen et al. 2001).

Surface water: photolysis $t_{1/2} = 0.78 \text{ h}$ (reported in units of minutes) in aqueous solution when irradiated with a 500 W medium pressure mercury lamp (Chen et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: elimination half-lives: $t_{1/2} = 2.0 \text{ d}$ from rainbow trout, $t_{1/2} = 26.2 \text{ d}$ from clam *Mya arenaria*, $t_{1/2} = 6.3\text{--}13.3 \text{ d}$ from mussel *Mytilus edulis*; $t_{1/2} = 9.2 \text{ d}$ from Oyster, $t_{1/2} = 1.2 \text{ d}$ from shrimp, $t_{1/2} = 5.7 \text{ d}$ from polychaete *Nereis virens*, $t_{1/2} = 8.0 \text{ d}$ from clam *Mercenaria mercenaria* (quoted, Meador et al. 1995).

TABLE 4.1.1.45.1

Reported vapor pressures of perylene at various temperatures and the coefficients for the vapor pressure equations

$$\begin{array}{ll} \log P = A - B/(T/K) & (1) \\ \log P = A - B/(C + t/^{\circ}\text{C}) & (2) \\ \log P = A - B/(C + T/K) & (3) \\ \log P = A - B/(T/K) - C \cdot \log (T/K) & (4) \end{array} \quad \begin{array}{ll} \ln P = A - B/(T/K) & (1a) \\ \ln P = A - B/(C + t/^{\circ}\text{C}) & (2a) \end{array}$$

FIGURE 4.1.1.45.1 Logarithm of vapor pressure versus reciprocal temperature for perylene.

4.1.1.46 7,12-Dimethylbenz[a]anthracene

Common Name: 7,12-Dimethylbenz[a]anthracene

Synonym: 7,12-dimethylbenz[a]anthracene, 9,10-dimethyl-1,2-benzanthracene, 7,12-dimethylbenzanthracene

Chemical Name: 7,12-dimethylbenz[a]anthracene

CAS Registry No: 57-97-6

Molecular Formula: $C_{20}H_{16}$

Molecular Weight: 256.341

Melting Point ($^{\circ}C$):

122.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

245.8 (Ruelle & Kesselring 1997)

292.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

104.56 (Kelley & Rice 1964)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

22.09 (Kelley & Rice 1964)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.111 (mp at $122.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.043 ($27^{\circ}C$, shake flask-nephelometry, Davis et al. 1942)

0.061 (shake flask-fluorescence, Mackay & Shiu 1977)

0.053 ($24^{\circ}C$, shake flask-nephelometry, Hollifield 1979)

0.025 ($24^{\circ}C$, shake flask-LSC, Means et al. 1979)

0.0244 (shake flask-LSC, Means et al. 1980b)

0.043, 0.061, 0.053; 0.054 (quoted lit. values; lit. mean, Pearlman et al. 1984)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.73×10^{-7} (solid vapor pressure, extrapolated, effusion method, Kelley & Rice 1974)

3.70×10^{-6} (extrapolated, supercooled liquid value P_L , Kelley & Rice 1974)

$\log(P_s/mmHg) = 15.108 - 7051/(T/K)$; temp range: $106-122^{\circ}C$ (effusion method, Kelley & Rice 1964)

$\log(P_L/mmHg) = 12.232 - 5987/(T/K)$; temp range: $122-135^{\circ}C$ (effusion method, Kelley & Rice 1964)

3.84×10^{-7} (extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 14.233 - 7051/(T/K)$; temp range 379–396 K (Antoine eq.-I, Stephenson & Malanowski 1987)

6.78×10^{-6} (extrapolated-Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 10.70417 - 5629.911/(T/K)$; temp range 379–390 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 11.357 - 5897/(T/K)$, temp range 396–408 K (Antoine eq.-III, Stephenson & Malanowski 1987)

6.38×10^{-6} (supercooled liquid P_L , calibrated GC-RT correlation, Lei et al. 2002)

$\log(P_L/Pa) = -4643/(T/K) + 10.38$; $\Delta H_{vap} = -88.9 kJ \cdot mol^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant ($Pa m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.98 (shake flask-LSC, concn. ratio, Means et al. 1979)

5.80 (shake flask-LSC, Means et al. 1980b)

6.16	(UNIFAC activity coeff., Banerjee & Howard 1988)
5.80	(recommended, Sangster 1989)
5.89	(recommended, Sangster 1993)
5.80	(recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.68	(average of 3 soil/sediment samples, sorption isotherms by shake flask-LSC, Means et al. 1979)
5.37	(average of 12 soil/sediment samples, sorption isotherms by shake flask-LSC, Means et al. 1980b)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Oxidation: photooxidation $t_{1/2} = 0.32\text{--}3.2$ h estimated, based on estimated rate constant for the reaction with hydroxyl radicals in air (Atkinson 1987; quoted, Howard et al. 1991); photooxidation $t_{1/2}(\text{aq.}) = 1.57\text{--}157$ yr estimated, based on measured rate constant for the reaction with singlet oxygen in benzene (Stevens et al. 1974; quoted, Howard et al. 1991).

Biodegradation: biodegradation $k = 0.0339\text{ d}^{-1}$ with $t_{1/2} = 20$ d for Kidman sandy loam soil and $k = 0.0252\text{ d}^{-1}$ with $t_{1/2} = 28$ d for McLaurin sandy loam soil (Park et al. 1990);

$t_{1/2}(\text{aq. aerobic}) \sim 480\text{--}672$ h, based on aerobic soil die-away test data (Sims 1990; quoted, Howard et al. 1991);

$t_{1/2}(\text{aq. anaerobic}) \sim 1920\text{--}2688$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.32\text{--}3.2$ h, based on estimated photooxidation half-life in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 480\text{--}672$ h, based on aerobic soil die-away test data (Howard et al. 1991).

Groundwater: $t_{1/2} = 960\text{--}1344$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: biodegradation rate constant $k = 0.0339\text{ d}^{-1}$ with $t_{1/2} = 20$ d for Kidman sandy loam soil and $k = 0.0252\text{ d}^{-1}$ with $t_{1/2} = 28$ d for McLaurin sandy loam soil (Park et al. 1990);

$t_{1/2} \sim 480\text{--}672$ h, based on aerobic soil die-away test data (Howard et al. 1991).

4.1.1.47 9,10-Dimethylbenz[a]anthracene

Common Name: 9,10-Dimethylbenz[a]anthracene

Synonym:

Chemical Name: 9,10-dimethylbenz[a]anthracene

CAS Registry No: 56-56-4

Molecular Formula: C₂₀H₁₆

Molecular Weight: 256.341

Melting Point (°C):

122 (Yalkowsky et al. 1983; Ruelle & Kesselring 1997)

Boiling Point (°C):

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

245.8 (Ruelle & Kesselring 1997)

292.7 (calculated-Le Bas method at normal boiling point)

Entropy of Fusion, ΔS_{fus} (J/mol K):

54.81 (Kelley & Rice 1974)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.112 (mp at 122°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated):

0.0435 (27°C, shake flask-nephelometry, Davis et al. 1942)

0.0435 (recommended, Shaw 1989)

Vapor Pressure (Pa at 25°C and reported temperature dependence equation):

log (P/mmHg) = 15.108 – 7051/(T/K); temp range: 106–135°C (effusion method, Kelley & Rice 1964)

log (P/mmHg) = 12.232 – 5897/(T/K) (liquid, effusion method, Kelley & Rice 1964)

Henry's Law Constant (Pa m³/mol):

Octanol/Water Partition Coefficient, log K_{ow}:

6.93 (calculated-fragment const., Yalkowsky et al. 1983)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC}:

Environmental Fate Rate Constants, k or Half-Lives, t_{1/2}:

Half-Lives in the Environment:

4.1.1.48 3-Methylcholanthrene

Common Name: 3-Methylcholanthrene

Synonym: 20-methylcholanthrene, 1,2-dihydro-3-methyl-benz[j]aceanthrylene

Chemical Name: 3-methylcholanthrene

CAS Registry No: 56-49-5

Molecular Formula: $C_{21}H_{16}$

Molecular Weight: 268.352

Melting Point ($^{\circ}C$):

180 (Bjørseth 1983)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

1.28 (Lide 2003)

Molar Volume (cm^3/mol):

247.8 (Ruelle & Kesselring 1997)

209.6 ($20^{\circ}C$, calculated-density)

296.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.0301 (mp at $180^{\circ}C$)

0.003 (Mackay et al. 1980)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0015 (Weimer & Prausnitz 1965)

0.0029 (shake flask-fluorescence, Mackay & Shiu 1977)

0.00323 (shake flask-liquid scintillation counting, Means et al. 1980)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 13.168 - 6643/(T/K)$; temp range $128-152^{\circ}C$ (effusion method, Kelley & Rice 1964)

1.03×10^{-7} (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 12.293 - 6643/(T/K)$; temp range $401-425 K$ (Antoine eq., Stephenson & Malanowski 1987)

1.48×10^{-6} (supercooled liquid P_L , calibrated GC-RT correlation, Lei et al. 2002)

$\log(P_L/Pa) = -4901/(T/K) + 10.61$; $\Delta H_{vap} = -93.8 kJ \cdot mol^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant ($Pa m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.42 (shake flask-LSC, Means et al. 1980)

7.11 (calculated-f const., Valvani & Yalkowsky 1980)

6.69 (calculated-S and mp, Mackay et al. 1980)

7.11 (Hansch & Leo 1985)

6.45, 7.07 (calculated-UNIFAC, calculated-fragment const., Banerjee & Howard 1988)

6.75 ± 0.50 (recommended, Sangster 1989)

6.45 (recommended, Sangster 1993)

6.42 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

4.12 (*Daphnia magna*, McCarthy et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

6.09 (soil/sediment, sorption isotherm by batch equilibrium-LSC, Means et al. 1980b)
 6.25 (average of 14 soil/sediment samples, sorption isotherm by shake flask-LSC, Means et al. 1980)
 6.09, 6.10 (calculated-regression of K_p versus substrate properties, calculated- K_{OW} , Means et al. 1980)
 4.02 (soil, calculated- K_{OW} , Briggs 1981)
 6.18 (soil, calculated- K_{OW} , Means et al. 1982)
 5.07 (soil, calculated- K_{OW} , Chiou et al. 1983)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Oxidation: photooxidation $t_{1/2} = 0.317\text{--}3.17$ h, based on estimated rate constant for reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Biodegradation: aerobic $t_{1/2} = 14616\text{--}33600$ h, based on mineralization half-life in fresh water and estuarine ecosystems (Heitkamp 1988; quoted, Howard et al. 1991);
 anaerobic $t_{1/2} = 58464\text{--}134400$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.317\text{--}3.17$ h, based on estimated photooxidation half-life in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 14616\text{--}33600$ h, based on mineralization half-life in fresh water and estuarine ecosystems (Heitkamp 1988; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 29232\text{--}672000$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 14616\text{--}33600$ h, based on estimated mineralization half-life in fresh water and estuarine ecosystems (Heitkamp 1988; quoted, Howard et al. 1991).

Biota:

4.1.1.49 Benzo[ghi]perylene

Common Name: Benzo[ghi]perylene

Synonym: 1,12-benzoperylene, benzoperylene

Chemical Name: 1,12-benzoperylene

CAS Registry No: 191-24-2

Molecular Formula: $C_{22}H_{12}$

Molecular Weight: 276.330

Melting Point ($^{\circ}C$):

272.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

525 (Pearlman et al. 1984)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

233.8 (Ruelle & Kesselring 1997; Passivirta et al. 1999)

277.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.365 (Ruelle & Kesselring 1997)

17.37 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

31.34, 43.2 (exptl., calculated-group additivity method, Chickos et al. 1999)

31.4 (Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, $F = 0.00373$ (mp at $272.5^{\circ}C$))

0.039 (calculated, $\Delta S_{fus} = 31.4 J/mol K$, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00026 (shake flask-fluorescence, Mackay & Shiu 1977)

0.0007 (generator column-HPLC/fluor., Wise et al. 1981)

0.00083 (quoted, Pearlman et al. 1984)

0.000137 (generator column-HPLC/fluor., De Maagd et al. 1998)

$\log [S_L/(mol/L)] = -2.073 - 908.7/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.39×10^{-8} (Knudsen effusion method, Murray et al. 1974)

$\log (P/atm) = 9.519 - 6674/(T/K)$; temp range: 389–468 K (Knudsen effusion method, Murray et al. 1974)

1.33×10^{-8} ($20^{\circ}C$, estimated, Callahan et al. 1979)

6.69×10^{-7} (Yamasaki et al. 1984)

1.38×10^{-8} ; 7.51×10^{-9} (extrapolated-Antoine eq. I, II, Stephenson & Malanowski 1987)

$\log (P_S/kPa) = 11.5247 - 6674/(T/K)$; temp range 389–468 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_S/kPa) = 10.945 - 6580/(T/K)$; temp range 391–513 K (Antoine eq.-II, Stephenson & Malanowski 1987)

7.20×10^{-6} ; 1.84×10^{-6} (quoted solid P_S from Mackay et al. 1992; converted to supercooled liquid P_L with fugacity ratio F , Passivirta et al. 1999)

$\log (P_S/Pa) = 12.40 - 5824/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 10.76 - 4915/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

4.28×10^{-7} (supercooled liquid P_L , calibrated GC-RT correlation, Lei et al. 2002)

$\log (P_L/Pa) = -5018/(T/K) + 10.46$; $\Delta H_{vap} = -96.1 kJ \cdot mol^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.027* (20°C , gas stripping-HPLC/fluorescence, measured range $10\text{--}55^\circ\text{C}$, ten Hulscher et al. 1992)

$\log (H/(\text{Pa m}^3/\text{mol})) = 12.83 - 4006/(T/K)$ (Passivirta et al. 1999)

0.0278 (20°C , selected from reported experimentally measured values, Staudinger & Roberts 1996, 2001)

$\log K_{\text{AW}} = -0.651 - 1258/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

7.10 (RP-TLC- k' correlation, Bruggeman et al. 1982)

7.05 (HPLC-RT correlation, Rapaport et al. 1984)

6.63 (HPLC-RT correlation, Wang et al. 1986)

6.90 (recommended, Sangster 1989, 1993)

7.04 (TLC retention time correlation, De Voogt et al. 1990)

6.63 (recommended, Hansch et al. 1995)

6.22 (range $5.95\text{--}6.38$) (shake flask/slow stirring-HPLC/fluor., De Maagd et al. 1998)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

5.54 (microorganisms-water, calculated from K_{OW} , Mabey et al. 1982)

4.45 (*Daphnia magna*, Newsted & Giesy 1987)

Sorption Partition Coefficient, $\log K_{\text{OC}}$ at 25°C or as indicated:

6.70 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)

7.215 (10°C), 7.08, 6.93 (20°C), 6.68 (35°C), 6.46, 6.51 (45°C) ($\log K_{\text{DOC}}$ - dissolved organic material from lake, gas-purge technique-HPLC/fluorescence, Lüers & ten Hulscher 1996)

6.80 (20°C , $\log K_{\text{POC}}$ - particulate organic material from lake, Lüers & ten Hulscher 1996)

6.82–8.25; 6.20–9.20 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)

5.87; 6.84, 6.82, 7.26 (20°C , batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: half-lives on different atmospheric particulate substrates (approx. $25\text{ }\mu\text{g/g}$ on substrate): $t_{1/2} = 7.0\text{ h}$ on silica gel, $t_{1/2} = 22\text{ h}$ on alumina and $t_{1/2} = 29\text{ h}$ on fly ash (Behymer & Hites 1985);

first order daytime photodegradation rate constants for adsorption on wood soot particles in an outdoor Teflon chamber: $k = 0.0077\text{ min}^{-1}$ with $1000\text{--}2000\text{ ng/mg}$ loading and $k = 0.0116\text{ min}^{-1}$ with $30\text{--}350\text{ ng/mg}$ loading (Kamens et al. 1988);

direct photolysis $t_{1/2}(\text{obs}) = 0.89\text{ h}$, $t_{1/2}(\text{calc}) = 0.86\text{ h}$ predicted by QSPR method in atmospheric aerosol (Chen et al. 2001).

Hydrolysis: no hydrolyzable groups (Howard et al. 1991).

Oxidation: rate constants $k < 60\text{ M}^{-1}\text{ h}^{-1}$ for singlet oxygen and $k < 6\text{ M}^{-1}\text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982); photooxidation $t_{1/2} = 0.321\text{--}3.21\text{ h}$, based on estimated rate constant for reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Biodegradation: aerobic $t_{1/2} = 14160\text{--}15600\text{ h}$, based on aerobic soil die-away test data at $10\text{--}30^\circ\text{C}$ (Coover & Sims 1987; quoted, Howard et al. 1991); anaerobic $t_{1/2} = 56640\text{--}62400\text{ h}$, based on aerobic soil die-away test data at $10\text{--}30^\circ\text{C}$ (Coover & Sims 1987; quoted, Howard et al. 1991).

Biotransformation: estimated to be $3 \times 10^{-12}\text{ mL cell}^{-1}\text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 0.076\text{--}0.21\text{ mg g}^{-1}\text{ h}^{-1}$; $k_2 = 0.0012\text{--}0.0014\text{ h}^{-1}$ (freshwater oligochaete from sediment, Van Hoof et al. 2001)

Half-Lives in the Environment:

Air: $t_{1/2} = 0.321\text{--}3.21$ h, based on estimated photooxidation half-life in air (Atkinson 1987; quoted, Howard et al. 1991); $t_{1/2} = 0.6$ h for adsorption on wood soot particles in an outdoor Teflon chamber with an estimated first order rate constant $k = 0.0179 \text{ min}^{-1}$ at $1 \text{ cal cm}^{-2} \text{ min}^{-1}$, $10 \text{ g/m}^3 \text{ H}_2\text{O}$ and 20°C (Kamens et al. 1988).

Surface water: $t_{1/2} = 14160\text{--}15600$ h, based on aerobic soil die-away test data at $10\text{--}30^\circ\text{C}$ (Coover & Sims 1987; quoted, Howard et al. 1991).

Groundwater: $t_{1/2} = 28320\text{--}31200$ h, based on aerobic soil die-away test data at $10\text{--}30^\circ\text{C}$ (Coover & Sims 1987; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 14160\text{--}15600$ h, based on aerobic soil die-away test data (Coover & Sims 1987; quoted, Howard et al. 1991);

$t_{1/2} > 50$ d (Ryan et al. 1988);

mean $t_{1/2} = 9.1$ yr for Luddington soil (Wild et al. 1991).

Biota: elimination $t_{1/2} = 12.4$ d from Oyster, $t_{1/2} = 4.8$ d from clam *Mercenaria mercenaria* (quoted, Meador et al. 1995).

1.33×10^{-8} ($20^{\circ}C$, estimated, Callahan et al. 1979)

3.70×10^{-10} * (effusion method, De Kruif 1980)

$\log (P/Pa) = 16.049 - 7395.4/(T/K)$; temp range: $163-189^{\circ}C$ (torsion-effusion, de Kruif 1980)

$\log (P/Pa) = 15.876 - 7312/(T/K)$; temp range: $163-189^{\circ}C$ (weighing-effusion, de Kruif 1980)

$\log (P/Pa) = 15.962 - 7730/(T/K)$; temp range: $163-189^{\circ}C$ (mean, de Kruif 1980)

4.25×10^{-10} (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_s/kPa) = 12.515 - 7420/(T/K)$; temp range $403-513\ K$ (Antoine eq., Stephenson & Malanowski 1987)

3.70×10^{-10} ; 9.31×10^{-8} (quoted solid P_s from Mackay et al. 1992; converted to supercooled liquid P_L with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.82 - 5824/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.82 - 5002/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

2.51×10^{-7} (supercooled liquid P_L , calibrated GC-RT correlation, Lei et al. 2002)

$\log (P_L/Pa) = -5193/(T/K) + 10.82$; $\Delta H_{vap} = -99.4\ kJ\cdot mol^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C and reported temperature dependence equations):

- 0.0074 (calculated-P/C, Mabey et al. 1982)
- 0.0076 (calculated-P/C, Eastcott et al. 1988)
- $\log [H/(\text{Pa m}^3/\text{mol})] = 11.23 - 3371/(T/K)$, (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.50 (shake flask-LSC, Means et al. 1980b)
- 6.88 (HPLC-RT/MS, Burkhard et al. 1985)
- 5.80 (Hansch & Leo 1985)
- 6.75 ± 0.40 (recommended, Sangster 1989, 1993)
- 7.11 (TLC retention time correlation, De Voogt et al. 1990)
- 6.60 (shake flask-UV, pH 7.4, Alcorn et al. 1993)
- 6.50 (recommended, Hansch et al. 1995)
- 6.54 ± 0.19 , 6.60 ± 0.78 (HPLC- k' correlation: ODS column; Diol column, Helweg et al. 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 5.84 (microorganisms-water, calculated from K_{OW} , Mabey et al. 1982)
- 4.63 (activated sludge, Freitag et al. 1984)
- 3.38, 4.63, 1.0 (algae, activated sludge, fish, Freitag et al. 1985)
- 4.00 (*Daphnia magna*, Newsted & Giesy 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.31 (average of 14 soil/sediment samples, equilibrium sorption isotherms by shake flask-LSC, Means et al. 1980b)
- 6.22, 6.18 (calculated-regression of k_p versus substrate properties, calculated- K_{OW} , Means et al. 1980b)
- 6.22; 6.11, 5.30, 5.62 (quoted; calculated- K_{OW} , calculated-S and mp, calculated-S, Karickhoff 1981)
- 6.52 (calculated- K_{OW} , Mabey et al. 1982)
- 5.20 (calculated, Pavlou 1987)
- 6.31; 6.44; 3.75–5.77 (soil, quoted exptl.; calculated-MCI $^1\chi$, calculated- K_{OW} range, Sabljic 1987a,b)
- 5.77 (soil, calculated- K_{OW} based on model of Karickhoff et al. 1979, Sabljic 1987b)
- 5.66 (soil, calculated- K_{OW} based on model of Means et al. 1982, Sabljic 1987b)
- 4.60 (soil, calculated- K_{OW} based on model of Chiou et al. 1983, Sabljic 1987b)
- 4.61 (soil, calculated- K_{OW} based on model of Kenaga 1980, Sabljic 1987b)
- 3.75 (soil, calculated- K_{OW} based on model of Briggs 1981, Sabljic 1987b)
- 6.22 (calculated-MCI $^1\chi$, Sabljic et al. 1995)
- 6.44 (humic acid, HPLC- k' correlation, Nielsen et al. 1997)
- 6.00; 6.30 (soil, calculated-universal solvation model; quoted exptl., Winget et al. 2000)
- 6.76–8.42; 5.80–8.50 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
- 6.03; 7.0, 6.76, 7.32 (20°C , batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: atmospheric and aqueous photolysis $t_{1/2} = 782$ h, based on measured rate of photolysis in heptane under November sunlight (Muel & Saguim 1985; quoted, Howard et al. 1991) and $t_{1/2} = 6$ h after adjusting the ratio of sunlight photolysis in water versus heptane (Smith et al. 1978; Muel & Saguim 1985; quoted, Howard et al. 1991);

pseudo-first-order direct photolysis rate constant $k(\text{exptl}) = 0.014 \text{ min}^{-1}$ with the calculated $t_{1/2} = 0.83$ h and the predicted $k = 0.0216 \text{ min}^{-1}$ calculated by QSPR method in aqueous solution when irradiated with a 500 W medium pressure mercury lamp (Chen et al. 1996);

direct photolysis $t_{1/2}(\text{obs.}) = 0.31$ h, $t_{1/2} = 0.38$ h predicted by QSPR method in atmospheric aerosol (Chen et al. 2001).

Oxidation: rate constant $k = 5 \times 10^8 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 1.5 \times 10^4 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982);

photooxidation $t_{1/2} = 0.428\text{--}4.28 \text{ h}$, based on estimated rate constant for reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: not hydrolyzable (Mabey et al. 1982); no hydrolyzable groups (Howard et al. 1991).

Biodegradation: aerobic $t_{1/2} = 8664\text{--}22560 \text{ h}$, based on aerobic soil die-away test data (Coover & Sims 1987; Sims 1990; quoted, Howard et al. 1991);

$k = 0.0019 \text{ d}^{-1}$ with $t_{1/2} = 361 \text{ d}$ for Kidman sandy loam and $k = 0.0017 \text{ d}^{-1}$ with $t_{1/2} = 420 \text{ d}$ for McLarin sandy loam all at -0.33 bar soil moisture (Park et al. 1990).

Biotransformation: estimated to be $3 \times 10^{-12} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: half-lives under simulated atmospheric conditions: $t_{1/2} = 9.6 \text{ h}$ in simulated sunlight, $t_{1/2} = 4.8 \text{ h}$ in simulated sunlight + ozone (0.2 ppm), $t_{1/2} = 2.71 \text{ h}$ in dark reaction ozone (0.2 ppm) (Katz et al. 1979; quoted, Bjørseth & Olufsen 1983);

$t_{1/2} = 0.428\text{--}4.28 \text{ h}$, based on estimated photooxidation half-life in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 6\text{--}782 \text{ h}$, based on sunlight photolysis half-life in water (Smith et al. 1978; Muel & Saguem 1985; quoted, Howard et al. 1991);

photolysis $t_{1/2} = 0.83 \text{ h}$ in aqueous solution when irradiated with a 500 W medium-pressure mercury lamp (Chen et al. 1996).

Groundwater: $t_{1/2} = 17328\text{--}45120 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: biodegradation rate constant $k = 0.0019 \text{ d}^{-1}$ with $t_{1/2} = 361 \text{ d}$ for Kidman sandy loam soil and $k = 0.117 \text{ d}^{-1}$ with $t_{1/2} = 420 \text{ d}$ for McLaurin sandy loam soil (Park et al. 1990);

$t_{1/2} \sim 8664\text{--}22560 \text{ h}$, based on aerobic soil dieaway test data (Coover & Sims 1987; Sims 1990; quoted, Howard et al. 1991);

mean $t_{1/2} = 20.607 \text{ wk}$ (quoted, Wild et al. 1991).

4.1.1.55 Coronene

Common Name: Coronene

Synonym: hexabenzobenzene

Chemical Name: coronene

CAS Registry No: 191-07-1

Molecular Formula: $C_{24}H_{12}$

Molecular Weight: 300.352

Melting Point ($^{\circ}C$):

437.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

525 (Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $25^{\circ}C$):

1.371 (Lide 2003)

Molar Volume (cm^3/mol):

244.8 (Ruelle & Kesselring 1997)

219.1 ($25^{\circ}C$, calculated-density)

292.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.202 (Ruelle & Kesselring 1997)

19.2 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

27.02, 42.8 (exptl., calculated-group additivity method, Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 8.99×10^{-5} (mp at $437.4^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00014 (shake flask-fluorescence, Mackay & Shiu 1977)

0.00014 (average lit. value, Pearlman et al. 1984)

0.00010 (generator column-HPLC/UV, Billington et al. 1988)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

$\log(P/mmHg) = 12.62 - 7675/(T/K)$; temp range $160-240^{\circ}C$ (Knudsen effusion method, Hoyer & Peperle 1958)

1.95×10^{-10} (Knudsen effusion method, extrapolated, Murray et al. 1974)

$\log(P/atm) = 9.110 - 7100/(T/K)$; temp range $427-510 K$ (Knudsen effusion method, Murray et al. 1974)

2.00×10^{-10} (extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 11.1157 - 7100/(T/K)$; temp range $427-510 K$ (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 8.886 - 5764/(T/K)$; temp range not specified (solid, Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 8.318 - 5362/(T/K)$; temp range not specified (liquid, Antoine eq.-III, Stephenson & Malanowski 1987)

2.89×10^{-10} * (gas saturation, extrapolated-Antoine eq. derived from exptl. data, temp range $148-231^{\circ}C$, Oja & Suuberg 1998)

$\log(P/Pa) = 31.72 - 16006/(T/K)$; temp range $421-504 K$ (Antoine eq., Knudsen effusion, Oja & Suuberg 1998)

2.55×10^{-8} (supercooled liquid P_L , calibrated GC-RT correlation, Lei et al. 2002)

$\log(P_L/Pa) = -5446/(T/K) + 10.67$; $\Delta H_{vap} = -104.2 kJ \cdot mol^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant (Pa m³/mol at 25°C):

Octanol/Water Partition Coefficient, log K_{OW}:

7.64	(average lit. value, Yalkowsky et al. 1983)
7.64	(calculated-MCI χ as per Rekker & De Kort 1979, Ruepert et al. 1985)

Molecular Formula: $C_{18}H_{11}Cl_3$

Molecular Weight: 333.639

Melting Point ($^{\circ}C$):

92 (Dickhut et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

335.9 (calculated-Le Bas method at normal boiling point)

Heat of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.22 (mp at $92^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

3.8×10^{-4} ; 3.37×10^{-4} (exptl. mean by generator column-GC method; calculated-TSA, Dickhut et al. 1994)
 1.01×10^{-4} , 6.56×10^{-4} , 8.56×10^{-4} (5, 25, $30^{\circ}C$, generator column-GC, Dickhut et al. 1994)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

4.1.2.2 2,4,4'',6-Tetrachloro-*p*-terphenyl

Common Name: 2,4,4'',6-Tetrachloro-*p*-terphenyl

Synonym:

Chemical Name:

CAS Registry No:

Molecular Formula: $C_{18}H_{11}Cl_4$

Molecular Weight: 368.084

Melting Point ($^{\circ}C$):

114 (Dickhut et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

356.8 (calculated-Le Bas method at normal boiling point)

Heat of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.134 (m.p at $114^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

1.79×10^{-4} ; 7.91×10^{-5} (exptl. mean by generator column-GC method; calculated-TSA, Dickhut et al. 1994)

5.91×10^{-5} , 1.74×10^{-4} , 4.07×10^{-4} (5, 25, $40^{\circ}C$, generator column-GC, Dickhut et al. 1994)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Half-Lives in the Environment:

4.1.3 POLYCHLORINATED NAPHTHALENES

4.1.3.1 1-Chloronaphthalene

Common Name: 1-Chloronaphthalene

Synonym: PCN-1, α -chloronaphthalene

Chemical Name: 1-chloronaphthalene

CAS Registry No: 90-13-1

Molecular Formula: $C_{10}H_7Cl$

Molecular Weight: 162.616

Melting Point ($^{\circ}C$):

−2.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

259 (Lide 200)

Density (g/cm^3):

1.1938 ($20^{\circ}C$, Weast 1982–83; Windholz 1983; Budavari 1989)

1.1976, 1.1938 ($15^{\circ}C$, $20^{\circ}C$, Riddick et al. 1986)

1.188 ($25^{\circ}C$, Lide 2003)

Molar Volume (cm^3/mol):

136.2 ($20^{\circ}C$, calculated-density)

168.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

22.4 (shake flask-fluorescence, Mackay & Shiu 1981)

19.0; 8.93 (quoted; calculated-molecular connectivity indices, Nirmalakhandan & Speece 1989)

2.87 (quoted, Crookes & Howe 1993, Alcock et al. 1999)

6.75; 36.3 (quoted exptl value; calculated-molar volume, Wang et al. 1992)

19.1; 25.8 (quoted; calculated-group contribution method, Kühne et al. 1995)

19.1; 25.2 (quoted; calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($80.6^{\circ}C$, static-Hg manometer, measured range 80.6 – $269.3^{\circ}C$, Kahlbaum 1898)

133.3* ($80.6^{\circ}C$, summary of literature data, temp range 80.6 – $269.3^{\circ}C$, Stull 1947)

3.055 (extrapolated from Antoine eq., temp range 353–533 K, Stephenson & Malanowski 1987)

$\log(P/kPa) = 6.15143 - [1861.65/(T/K - 83.337)]$; temp range: 353–533 K (Antoine eq., Stephenson & Malanowski 1987)

2.133 (estimated, Crookes & Howe 1993)

1.2×10^{-4} (estimated, Alcock et al. 1999)

3.597, 3.84 (calibrated GC-RT correlation, GC-RT correlation, P_L supercooled liquid values, Lei et al. 1999)

$\log(P_L/Pa) = -3058/(T/K) + 10.81$ (HPLC-RT correlation, Lei et al. 1999)

5.588 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3054/(T/K) + 9.97$; (regression with GC-RT from literature, supercooled liquid, Lei et al. 1999)

6.89* ($23.15^{\circ}C$, transpiration method, measured range 289.1–332.3 K, Verevkin 2003)

$\ln (P/P^\circ) = 299.001/R - 83941.481/R \cdot (T/K) - (73.5/R) \cdot \ln[(T/K)/298.15]$, where $P^\circ = 101.325$ kPa, gas constant $R = 8.31451$ J·K⁻¹·mol⁻¹ (vapor pressure eq. from transpiration measurement, temp range 289.1–332.3 K, Verevkin 2003)

Henry's Law Constant (Pa·m³/mol at 25°C):

- 35.5 (gas stripping-GC, Mackay & Shiu 1981)
36.3 (gas stripping-GC, Shiu & Mackay 1997)

Octanol/Water Partition Coefficient, log K_{ow} at 25°C and the reported temperature dependence equations:

- 3.80 (HPLC-k'correlation, Hanai et al. 1981)
4.08 (calculated-fragment constant, Yalkowsky et al. 1983)
3.90 (shake flask, Opperhuizen 1987)
4.08 (estimated, Abernethy & Mackay 1987)
3.80 (calculated-molar volume, Wang et al. 1992)
4.24 (recommended, Hansch et al. 1995)
4.0; 3.97 (calibrated HPLC-RT correlation; HPLC-RT correlation, Lei et al. 2000)
 $\log K_{ow} = 0.841 + 940.09/(T/K)$, temp range 5–55°C (temperature dependence HPLC-k'correlation, Lei et al. 2000)
4.06 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated and reported temperature dependence equations:

- 6.39, 6.10, 5.52, 5.30, 5.13 (10, 20, 30, 40, 50°C, GC-RT correlation, Su et al. 2002)
 $\log K_{OA} = 58300/(2.303 \cdot RT) - 4.40$; temp range 10–50°C (GC-RT correlation, Su et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

- 2.28 (*Cyprinus carpio*, for monochloronaphthalenes, Matsuo 1984; quoted, Crookes & Howe 1993)

Sorption Partition Coefficient, log K_{OC} :

- 2.97 (estimated for mono-chloronaphthalenes, Crookes & Howe 1993)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

FIGURE 4.1.3.1.1 Logarithm of vapor pressure versus reciprocal temperature for 1-chloronaphthalene.

4.1.3.2 2-Chloronaphthalene

Common Name: 2-Chloronaphthalene

Synonym: PCN-2, β -chloronaphthalene

Chemical Name: 2-chloronaphthalene

CAS Registry No: 91-58-7

Molecular Formula: $C_{10}H_7Cl$

Molecular Weight: 162.616

Melting Point ($^{\circ}C$):

58 (Lide 2003)

Boiling Point ($^{\circ}C$):

256 (Weast 1982–83; Windholz 1983; Budavari 1989; Järnberg et al. 1994; Lide 2003)

Density (g/cm^3):

1.1377 (71 $^{\circ}C$, Weast 1982–83; Lide 2003)

Molar Volume (cm^3/mol):

142.9 (71 $^{\circ}C$, calculated from density, Stephenson & Malanowski 1987)

168.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

3.346 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25 $^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K, F: 0.474 (mp at 58 $^{\circ}C$))

Water Solubility (g/m^3 or mg/L at 25 $^{\circ}C$):

11.7 (shake flask-fluorescence, Mackay & Shiu 1981)

0.924 (shake flask, Opperhuizen et al. 1985, 1986)

8.93 (calculated-molecular connectivity indices, Nirmalakhandan & Speece 1989)

16.3 (calculated-group contribution method, Kühne et al. 1995)

7.80 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at 25 $^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5.34 (supercooled liquid value, extrapolated from Antoine eq., temperature range 400–435 K, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.8608 - [3021.2/(T/K)]$; temp range 400–435 K (Antoine eq., Stephenson & Malanowski 1987)

3.679, 3.84 (supercooled liquid values P_L : calibrated GC-RT correlation, GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3054/(T/K) + 10.81$ (GC-RT correlation, supercooled liquid, Lei et al. 1999)

2.526 (supercooled liquid P_L , regression with GC-RT data from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3054/(T/K) + 9.97$ (regression with GC-RT data from literature, Lei et al. 1999)

2.301* (24.15 $^{\circ}C$, transpiration method, measured range 280.2–330.7 K, Verevkin 2003)

$\ln(P/P^{\circ}) = 301.255/R - 87496.950/R \cdot (T/K) - (39.5/R) \cdot \ln[(T/K)/298.15]$, where $P^{\circ} = 101.325$ kPa, gas constant $R = 8.31451$ J·K $^{-1}$ ·mol $^{-1}$ (vapor pressure eq. from transpiration measurement, solid, temp range 280.2–330.7 K, Verevkin 2003)

53.71* (59.05 $^{\circ}C$, transpiration method, measured range 332.2–362.2 K, Verevkin 2003)

$\ln(P/P^{\circ}) = 294.501/R - 84197.803/R \cdot (T/K) - (73.5/R) \cdot \ln[(T/K)/298.15]$, where $P^{\circ} = 101.325$ kPa, gas constant $R = 8.31451$ J·K $^{-1}$ ·mol $^{-1}$ (vapor pressure eq. from transpiration measurements, liquid, temp range 332.2–362.2 K, Verevkin 2003)

Henry's Law Constant (Pa·m 3 /mol at 25 $^{\circ}C$):

31.9 (gas stripping-GC, Mackay & Shiu 1981)

33.5 (gas stripping-GC, Shiu & Mackay 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C and the reported temperature dependence equations:

- 4.80 (calculated-fragment constant, Yalkowsky et al. 1983)
- 4.19 (HPLC-RT correlation, Opperhuizen et al. 1985, 1986)
- 4.08 (estimated, Abernethy & Mackay 1987)
- 3.98 (shake flask, Opperhuizen 1987)
- 4.07 (selected, Isnard & Lambert 1988; 1989)
- 4.6024 (calculated-UNIFAC group contribution, Chen et al. 1993)
- 4.14 (selected, Hansch et al. 1995)
- 3.90; 3.91 (calibrated HPLC-RT correlation; HPLC-RT correlation, Lei et al. 2000)
- $\log K_{OW} = 0.821 + 924.42/(T/K)$, temp range 5–55°C (temperature dependence HPLC- k' correlation, Lei et al. 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 6.36, 6.08, 5.50, 5.28, 5.11 (10, 20, 30, 40, 50°C, GC-RT correlation, Su et al. 2002)
- $\log K_{OA} = 58000/(2.303 \cdot RT) - 4.40$; temp range 10–50°C (GC-RT correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 2.28 (*Cyprinus carpio*, for monochloronaphthalenes, Matsuo 1981)
- 3.63 (guppies, Opperhuizen et al. 1985)
- 3.63, 4.81 (whole fish, fish lipid, Gobas et al. 1987)
- 4.52 (guppy, lipid-weight based, Gobas et al. 1989)
- 3.63; 3.06 (quoted means; calculated- K_{OW} and S_0 , Banerjee & Baughman 1991)
- 3.63 (*Poecilia reticulata*, under static and semi-static conditions, quoted, Devillers et al. 1996)
- 2.496, 2.721 (calculated-MCI χ , calculated- K_{OW} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.97 (estimated for monochloronaphthalenes, Crookes & Howe 1993)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis: laboratory determined hydrolysis rate constant $k = (9.5 \pm 2.8) \times 10^{-6} \text{ h}^{-1}$ at neutral conditions, calculated $t_{1/2} = 8.3 \text{ yr}$ at pH 7 (Ellington et al. 1988).

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_1 = 7.3 \times 10^2 \text{ d}^{-1}$; $k_2 = 3.1 \times 10^{-1} \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1985; quoted, Connell & Hawker 1988)
- $\log k_1 = 2.83 \text{ d}^{-1}$; $\log k_2 = -0.51 \text{ d}^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil: experimentally measured abiotic disappearance $t_{1/2} = 11.3 \text{ d}$ in two different soil types, a Captina silt loam (Typic Fragiudult) and McLaurin sandy loam (Typic Paleudults) (Anderson et al. 1991).

Biota: $t_{1/2} = 2.3 \text{ d}$ (female guppies, Opperhuizen et al. 1985, quoted, Crookes & Howe 1993)

TABLE 4.1.3.2.1

Reported vapor pressures of 2-chloronaphthalene at various temperatures and the coefficients for the vapor pressure equations

$$\begin{aligned}\log P &= A - B/(T/K) & (1) & \quad \ln P = A - B/(T/K) & (1a) \\ \log P &= A - B/(C + t/^{\circ}\text{C}) & (2) & \quad \ln P = A - B/(C + t/^{\circ}\text{C}) & (2a) \\ \log P &= A - B/(C + T/K) & (3) & \\ \log P &= A - B/(T/K) - C \cdot \log(T/K) & (4) & \quad \ln P/P^{\circ} = A - B/(T/K) - C \cdot \ln[(T/K)/298.15] & (4a)\end{aligned}$$

4.1.3.3 1,2-Dichloronaphthalene

Common Name: 1,2-Dichloronaphthalene

Synonym: PCN-3

Chemical Name: 1,2-dichloronaphthalene

CAS Registry No: 2050-69-3

Molecular Formula: $C_{10}H_6Cl_2$

Molecular Weight: 197.061

Melting Point ($^{\circ}C$):

36 (Lide 2003)

Boiling Point ($^{\circ}C$):

295.6 (Lide 2003)

Density (g/cm^3): 1.3147 (49 $^{\circ}C$, Weast 1982–83; Lide 2003)

Molar Volume (cm^3/mol):

156 (Ruelle & Kesselring 1997)

189.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25 $^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.78 (mp at 36 $^{\circ}C$)

Water Solubility (g/m^3 or mg/L at 25 $^{\circ}C$):

0.137 (generator column-GC/ECD, Opperhuizen 1987)

4.31 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at 25 $^{\circ}C$ and reported temperature dependence equations):

0.344; 0.333 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3172/(T/K) + 10.18$; (GC-RT correlation, supercooled liquid, Lei et al. 1999)

0.301 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3172/(T/K) + 10.11$ (regression with GC-RT from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25 $^{\circ}C$ and the reported temperature dependence equations:

4.40 (HPLC-RT correlation, Opperhuizen et al. 1985)

4.42 (shake flask, Opperhuizen 1987; quoted, Sangster 1993, Crookes & Howe 1993, Hansch et al. 1995)

4.66 (selected, Alcock et al. 1999)

4.60; 4.45 (calibrated HPLC-RT correlation; HPLC-RT correlation, Lei et al. 2000)

$\log K_{OW} = 1.064 + 1060.21/(T/K)$, temp range 5–55 $^{\circ}C$ (temperature dependence HPLC- k' correlation, Lei et al. 2000)

4.69 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25 $^{\circ}C$ or as indicated and reported temperature dependence equations:

6.93 (generator column-GC, Harner & Bidleman 1998)

7.35, 7.01, 6.44, 6.13, 5.91 (10, 20, 30, 40, 50 $^{\circ}C$, GC-RT correlation, Su et al. 2002)

$\log K_{OA} = 66000/(2.303 \cdot RT) - 4.800$; temp range 10–50 $^{\circ}C$ (GC-RT correlation, Su et al. 2002)

6.89; 7.01 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.40 (fish, Opperhuizen et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

4.1.3.4 1,4-Dichloronaphthalene

Common Name: 1,4-Dichloronaphthalene

Synonym: PCN-5

Chemical Name: 1,4-dichloronaphthalene

CAS Registry No: 1825-31-6

Molecular Formula: $C_{10}H_6Cl_2$

Molecular Weight: 197.061

Melting Point ($^{\circ}C$):

67.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

288 (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

156.0 (Ruelle & Kesselring 1997)

189.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.383 (mp at $288^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.314 (generator column-GC/ECD, Opperhuizen et al. 1985)

0.314 (generator column-GC/ECD, Opperhuizen et al. 1987)

4.02 (calculated-TSA, Dickhut et al. 1994)

1.98 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.173 (estimated, Crookes & Howe 1993)

9.98×10^{-6} (estimated, Alcock et al. 1999)

0.428; 0.416 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3067/(T/K) + 9.92$ (GC-RT correlation, supercooled liquid, Lei et al. 1999)

0.353 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3067/(T/K) + 10.17$ (regression with GC-RT from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$ at $25^{\circ}C$ and the reported temperature dependence equations:

4.88 (HPLC-RT correlation, Opperhuizen et al. 1985)

4.66 (shake flask, Opperhuizen 1987; quoted, Gobas et al. 1987; 1989; Clark et al. 1990; Sangster 1993; Crookes & Howe 1993; Hansch et al. 1995; Devillers et al. 1996; Alcock et al. 1999)

4.79 (calculated, Oliver & Niimi 1984; Oliver 1987)

4.80; 4.57 (calibrated HPLC-RT correlation; HPLC-RT correlation, Lei et al. 2000)

$\log K_{ow} = 1.269 + 1049.8/(T/K)$, temp range $5-55^{\circ}C$ (temperature dependence HPLC- k' correlation, Lei et al. 2000)

4.56 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations:

6.93 (generator column-GC/MS, Harner & Bidleman 1998)

7.52, 7.13, 6.72, 6.38, 6.13 (10, 20, 30, 40, $50^{\circ}C$, generator column-GC/MS, Harner & Bidleman 1998)

$\log K_{OA} = -3.97 + 3248/(T/K)$, temp range: 10–50°C (generator column-GC/MS, Harner & Bidleman 1998)
6.78; 6.91 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

3.75 (*Oncorhynchus mykiss*, Oliver & Niimi 1984)
3.36 (female guppies, Opperhuizen et al. 1985)
3.80 (Opperhuizen et al. 1985)
4.04 (Opperhuizen et al. 1985)
3.36, 4.54 (guppies: whole fish, fish lipid, Gobas et al. 1987)
3.75 (rainbow trout, Oliver & Niimi 1984; Oliver 1987)
5.18 (guppy, lipid-weight based, Gobas et al. 1989)
3.36; 4.63 (quoted means; calculated- K_{OW} and S_0 , Banerjee & Baughman 1991)
3.75 (*Oncorhynchus mykiss*, under flow-through condition, quoted Devillers et al. 1996)
3.36 (*Poecilia reticulata*, under static and semi-static conditions, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation: rate constant $k = 5.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reactions with OH radical at $298 \pm 2 \text{ K}$ (Atkinson 1989).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 1.2 \times 10^3 \text{ d}^{-1}$; $k_2 = 1.1 \times 10^{-1} \text{ d}^{-1}$ (guppies, Opperhuizen et al. 1985)
 $\log k_1 = 3.04 \text{ d}^{-1}$; $\log k_2 = -0.96 \text{ d}^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Biota: $t_{1/2} = 6.2 \text{ d}$ (guppies, Opperhuizen et al. 1985; quoted, Crookes & Howe 1993)

4.1.3.5 1,8-Dichloronaphthalene

Common Name: 1,8-Dichloronaphthalene

Synonym: PCN-9

Chemical Name: 1,8-dichloronaphthalene

CAS Registry No: 2050-74-0

Molecular Formula: $C_{10}H_6Cl_2$

Molecular Weight: 197.061

Melting Point ($^{\circ}C$):

89 (Weast 1982-83; Lide 2003)

Boiling Point ($^{\circ}C$):

sublimation (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

156.0 (Ruelle & Kesselring 1997)

189.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.236 (mp at $89^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.315 (generator column-GC/ECD, Opperhuizen et al. 1985)

0.059 (generator column-GC/ECD, Opperhuizen et al. 1987)

0.309 (Isnard & Lambert 1988, 1989; quoted, Crookes & Howe 1993)

1.27 (calculated-molar volume mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equation):

0.198 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3169/(T/K) + 9.93$ (regression with GC-RT from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.41 (HPLC-RT, Opperhuizen et al. 1985)

4.19 (shake flask-GC, Opperhuizen 1987; quoted, Sangster 1993; Hansch et al. 1995)

5.4348 (calculated-UNIFAC, Chen et al. 1993)

4.85 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.79 (guppies, Opperhuizen et al. 1985)

3.79. 4.96 (guppies: whole fish, fish lipid, Gobas et al. 1987)

4.95 (guppy, lipid-weight based, Gobas et al. 1989)

3.79 (*Poecilia reticulata*, under static and semi-static conditions, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 9.8 \times 10^2 d^{-1}$; $k_2 = 1.6 \times 10^{-1} d^{-1}$ (guppies, Opperhuizen et al. 1985)

$\log k_1 = 2.97 d^{-1}$; $\log k_2 = -0.80 d^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Biota: elimination $t_{1/2} = 4.3 d$ (guppies, Opperhuizen et al. 1985; Crookes & Howe 1993)

4.1.3.6 2,3-Dichloronaphthalene

Common Name: 2,3-Dichloronaphthalene

Synonym: PCN-10

Chemical Name: 2,3-dichloronaphthalene

CAS Registry No: 2050-75-1

Molecular Formula: $C_{10}H_6Cl_2$

Molecular Weight: 197.061

Melting Point ($^{\circ}C$):

120 (Weast 1982-83; Ruelle & Kesselring 1997; Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

156.0 (Ruelle & Kesselring 1997)

189.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K, F: 0.117 (mp at $120^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0862 (generator column-GC/ECD, Opperhuizen et al. 1985; 1987)

0.623 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equation):

0.333 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3169/(T/K) + 10.15$ (regression with GC-RT from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.71 (HPLC-RT correlation, Opperhuizen et al. 1985)

4.51 (shake flask, Opperhuizen 1987)

4.78 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.04 (guppies, Opperhuizen et al. 1985)

4.04, 5.22 (guppies: whole fish, fish lipid, Gobas et al. 1987)

5.08 (guppy, lipid-weight based, Gobas et al. 1989)

4.04 (*Poecilia reticulata*, under static and semi-static conditions, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 1.6 \times 10^3 d^{-1}$; $k_2 = 1.4 \times 10^{-1} d^{-1}$ (guppies, Opperhuizen et al. 1985)

$\log k_1 = 3.05 d^{-1}$; $\log k_2 = -0.85 d^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Biota: elimination $t_{1/2} = 5.1 d$ (guppies, Opperhuizen et al. 1985; quoted, Crookes & Howe 1993)

4.1.3.7 2,7-Dichloronaphthalene

Common Name: 2,7-Dichloronaphthalene

Synonym: PCN-12

Chemical Name: 2,7-dichloronaphthalene

CAS Registry No: 2198-77-8

Molecular Formula: $C_{10}H_6Cl_2$

Molecular Weight: 197.061

Melting Point ($^{\circ}C$):

115 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

156.0 (Ruelle & Kesselring 1997)

189.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.131 (mp at $115^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.236 (generator column-GC/ECD, Opperhuizen et al. 1985)

0.235 (reported as 2,8-dichloronaphthalene, generator column-GC/ECD, Opperhuizen 1987)

0.699 (calculated-molar volume mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.344 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3169/(T/K) + 10.16$ (regression with GC-RT from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.81 (HPLC-RT correlation, Opperhuizen et al. 1985)

4.56 (shake flask-GC, Opperhuizen 1987)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ and reported temperature dependence equation:

7.28, 6.95, 6.38, 6.08, 5.85 (10, 20, 30, 40, $50^{\circ}C$, GC-RT correlation, Su et al. 2002)

$\log K_{OA} = 65400/(2.303 \cdot RT) - 4.80$; temp range 10 – $50^{\circ}C$ (GC-RT correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.04 (guppies, Opperhuizen et al. 1985; Crookes & Howe 1993, Lu et al. 1999)

4.04 (guppies: whole fish, fish lipid, Gobas et al. 1987)

5.11 (guppy, lipid-weight based, Gobas et al. 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 1.6 \times 10^3$ d^{-1} ; $k_2 = 1.4 \times 10^{-1}$ d^{-1} (guppies, Opperhuizen et al. 1985)

$\log k_1 = 3.08$ d^{-1} ; $\log k_2 = -0.85$ d^{-1} (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Biota: depuration $t_{1/2} = 5.1$ d (guppies, Opperhuizen et al. 1985; quoted, Crookes & Howe 1993)

4.1.3.8 1,2,3-Trichloronaphthalene

Common Name: 1,2,3-Trichloronaphthalene

Synonym: PCN-13

Chemical Name: 1,2,3-trichloronaphthalene

CAS Registry No: 50402-52-3

Molecular Formula: $C_{10}H_5Cl_3$

Molecular Weight: 231.506

Melting Point ($^{\circ}C$):

81–84 (Järnberg et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

210.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0197; 0.0173 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3825/(T/K) + 11.12$; (GC-RT correlation, supercooled liquid, Lei et al. 1999)

0.0162(supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3825/(T/K) + 10.96$ (regression with GC-RT from literature, Lei et al. 1999)

0.00536 – P_S ; 0.0975 – P_L (estimated for tetrachloronaphthalenes, Kaupp & McLachlan 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$ at $25^{\circ}C$ and the reported temperature dependence equations:

5.94 (HPLC-RT correlation, Opperhuizen et al. 1985)

5.90 (HPLC-RT correlation, Opperhuizen et al. 1985)

5.75 (shake flask-GC, Opperhuizen 1987)

6.30; 5.76 (calibrated HPLC-RT correlation; HPLC-RT correlation, Lei et al. 2000)

$\log K_{ow} = 1.832 + 1347.46/(T/K)$, temp range $5-55^{\circ}C$ (temperature dependence HPLC- k' correlation, Lei et al. 2000)

5.91 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equation:

9.03, 8.59, 8.05, 7.59, 7.26 (10, 20, 30, 40, $50^{\circ}C$, GC-RT correlation, Su et al. 2002)

$\log K_{OA} = 79500/(2.303 \cdot RT) - 5.60$; temp range $10-50^{\circ}C$ (GC-RT correlation, Su et al. 2002)

8.30; 8.29 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

3.94	(<i>Cyprinus carpio</i> , Matsuo 1981)
3.71	(<i>Oncorhynchus mykiss</i> , Oliver & Niimi 1984)
4.52	(guppies, Opperhuizen et al. 1985)
4.50	(fish, Opperhuizen et al. 1985)
4.66, 5.71	(whole fish, fish lipid, Gobas et al. 1987)
3.71	(rainbow trout, mean value, Oliver & Niimi 1985)
5.96	(guppy, lipid-weight based, Gobas et al. 1989)

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 3.3 \times 10^3 \text{ d}^{-1}$; $k_2 = 9.9 \times 10^{-2} \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1985)

$k_1 = 1.3 \times 10^3 \text{ d}^{-1}$ (estimated, Opperhuizen et al. 1985)

$\log k_1 = 3.70 \text{ d}^{-1}$; $\log k_2 = -1.08 \text{ d}^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Biota: $t_{1/2} = 7 \text{ d}$ (guppies, Opperhuizen et al. 1985; quoted, Crookes & Howe 1993)

4.1.3.11 1,2,3,5-Tetrachloronaphthalene

Common Name: 1,2,3,5-Tetrachloronaphthalene

Synonym: PCN-28

Chemical Name: 1,2,3,5-tetrachloronaphthalene

CAS Registry No: 53555-63-8

Molecular Formula: $C_{10}H_4Cl_4$

Molecular Weight: 265.951

Melting Point ($^{\circ}C$):

141 (Järnberg et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

231.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0728 (mp at $141^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.0203; 0.0179 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -3836/(T/K) + 11.17$; (GC-RT correlation, supercooled liquid, Lei et al. 1999)

0.0205 (supercooled liquid P_L , regression with GC-RT data from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3800/(T/K) + 11.06$ (regression with GC-RT data from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.78 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equation:

8.98, 8.55, 8.00, 7.55, 7.22 (10, 20, 30, 40, $50^{\circ}C$, GC-RT correlation, Su et al. 2002)

$\log K_{OA} = 79100/(2.303 \cdot RT) - 5.60$; temp range 10 – $50^{\circ}C$ (GC-RT correlation, Su et al. 2002)

8.29; 8.28 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

4.1.3.12 1,3,5,7-Tetrachloronaphthalene

Common Name: 1,3,5,7-Tetrachloronaphthalene

Synonym: PCN-42

Chemical Name: 1,3,5,7-tetrachloronaphthalene

CAS Registry No: 53555-64-9

Molecular Formula: $C_{10}H_4Cl_4$

Molecular Weight: 265.951

Melting Point ($^{\circ}C$):

179 (Crookes & Howe 1993)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

181.8 (Ruelle & Kesselring 1997)

231.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0308 (mp at $179^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00426 (generator column-GC/ECD, Opperhuizen et al. 1985)

0.0040 (generator column-GC/ECD, Opperhuizen 1987)

0.0237 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.0480 (estimated, Crookes & Howe 1993)

2.70×10^{-6} (estimated, Alcock et al. 1999)

0.0415 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3800/(T/K) + 11.36$ (regression with GC-RT from literature, Lei et al. 1999)

$0.00536 - P_S$; $0.0975 - P_L$ (estimated for tetrachloronaphthalenes, Kaupp & McLachlan 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.38 (HPLC-RT correlation, Opperhuizen et al. 1985)

6.40 (Opperhuizen 1986)

6.19 (shake flask, Opperhuizen 1987; selected, Hansch et al. 1995)

5.54 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equation:

8.39 (estimated value for tetrachloronaphthalenes, Kaupp & McLachlan 1999)

8.58, 8.18, 7.62, 7.21, 6.90 (10, 20, 30, 40, $50^{\circ}C$, GC-RT correlation, Su et al. 2002)

$\log K_{OA} = 75000/(2.303 \cdot RT) - 5.40$; temp range $10-50^{\circ}C$ (GC-RT correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.53 (guppies, Opperhuizen et al. 1985)

4.50 (guppies, Opperhuizen et al. 1985)

5.06, 5.71 (guppies: whole fish, fish lipid, Gobas et al. 1987)

5.81 (guppy, lipid-weight based, Gobas et al. 1989)
4.53; 4.37 (quoted means; calculated- K_{OW} and S, Banerjee & Baughman 1991)
4.701, 4.961 (calculated-MCI χ , calculated- K_{OW} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 7.5 \times 10^2 \text{ d}^{-1}$; $k_2 = 2.2 \times 10^{-2} \text{ d}^{-1}$ (guppies, Opperhuizen et al. 1985)

$\log k_1 = 2.97 \text{ d}^{-1}$; $\log k_2 = -1.66 \text{ d}^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Biota: $t_{1/2} = 30 \text{ d}$ (guppies, Opperhuizen et al. 1985)

4.1.3.13 1,3,5,8-Tetrachloronaphthalene

Common Name: 1,3,5,8-Tetrachloronaphthalene

Synonym: PCN-43

Chemical Name: 1,3,5,8-tetrachloronaphthalene

CAS Registry No: 31604-28-1

Molecular Formula: $C_{10}H_4Cl_4$

Molecular Weight: 265.951

Melting Point ($^{\circ}C$):

131 (Crookes & Howe 1993; Järnberg et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

181.8 (Ruelle & Kesselring 1997)

231.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0912 (mp at $131^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00825 (generator column-GC/ECD, Opperhuizen et al. 1985)

0.0030 (Opperhuizen 1986)

0.0082 (generator column-GC/ECD, Opperhuizen 1987)

0.0716 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.0208 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -3800/(T/K) + 11.07$ (regression with GC-RT from literature, Lei et al. 1999)

$0.00536 - P_S$; $0.0975 - P_L$ (estimated for tetrachloronaphthalenes, Kaupp & McLachlan 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.96 (HPLC-RT correlation, Opperhuizen et al. 1985; selected, Sangster 1993)

6.00 (Opperhuizen et al. 1985; Opperhuizen 1986)

5.76 (shake flask, Opperhuizen 1987; selected, Hansch et al. 1995)

5.81 (selected, Gobas et al. 1987, 1989)

5.78 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations:

8.39 (value for tetrachloronaphthalenes, Kaupp & McLachlan 1999)

8.98, 8.55, 8.00, 7.55, 7.22 (10, 20, 30, 40, $50^{\circ}C$, GC-RT correlation, Su et al. 2002)

$\log K_{OA} = 79100/(2.303 \cdot RT) - 5.60$; temp range $10-50^{\circ}C$ (GC-RT correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.40 (guppies, Opperhuizen et al. 1985)

4.69, 5.57 (guppies: whole fish, fish lipid, Gobas et al. 1987)

5.62 (guppy, lipid-weight based, Gobas et al. 1989)

4.701, 4.582 (calculated-MCI χ , calculated- K_{OW} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$$k_1 = 1.2 \times 10^3 \text{ d}^{-1}; k_2 = 4.5 \times 10^{-2} \text{ d}^{-1} \quad (\text{guppies, Opperhuizen et al. 1985})$$

$$k_1 = 1.4 \times 10^3 \text{ d}^{-1} \quad (\text{fish, Opperhuizen 1986})$$

$$\log k_1 = 3.10 \text{ d}^{-1}; \log k_2 = -1.35 \text{ d}^{-1} \quad (\text{guppy, Gobas et al. 1989})$$

Half-Lives in the Environment:

$$\text{Biota: } t_{1/2} = 15.5 \text{ d (guppies, Opperhuizen et al. 1985)}$$

4.1.3.14 1,2,3,4,6-Pentachloronaphthalene

Common Name: 1,2,3,4,6-Pentachloronaphthalene

Synonym: PCN-50

Chemical Name: 1,2,3,4,6-pentachloronaphthalene

CAS Registry No: 67922-25-2

Molecular Formula: $C_{10}H_3Cl_5$

Molecular Weight: 300.396

Melting Point ($^{\circ}C$):

147 (Crookes & Howe 1993; Järnberg et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

252.1 (calculated-Le Bas method at normal boiling point)

Boiling Point ($^{\circ}C$):

331 (estimated, Crookes & Howe 1993)

Density (g/cm^3):

Molar Volume (cm^3/mol):

273.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.022 (mp at $194^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00011 (estimated, Crookes & Howe 1993)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

9.47×10^{-4} (estimated, Crookes & Howe 1993)

5.30×10^{-8} (estimated, Alcock et al. 1999)

0.00134 (supercooled liquid P_L , regression with GC-RT data from literature, Lei et al. 1999)

$\log(P_L/Pa) = -4432/(T/K) + 11.99$ (regression with GC-RT data from literature, Lei et al. 1999)

$0.000257 - P_S$; $0.00809 - P_L$ (estimated for hexachloronaphthalenes, Kaupp & McLachlan 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.58 (estimated, Crookes & Howe 1993, quoted, Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and the reported temperature dependence equations:

9.80 (generator-column-GC, Harner & Bidleman 1998)

10.07, 9.57, 8.95, 8.54 (20, 30, 40, $50^{\circ}C$, generator column-GC/MS, Harner & Bidleman 1998)

$\log K_{OA} = -6.77 + 4393/(T/K)$; temp range: 20 – $50^{\circ}C$ (generator column-GC/MS, Harner & Bidleman 1998)

10.02 (value for hexachloronaphthalenes, Kaupp & McLachlan 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

4.1.3.18 1,2,3,4,6,7-Hexachloronaphthalene

Common Name: 1,2,3,4,6,7-Hexachloronaphthalene

Synonym: PCN-66

Chemical Name: 1,2,3,4,6,7-hexachloronaphthalene

CAS Registry No: 103426-96-6

Molecular Formula: $C_{10}H_2Cl_6$

Molecular Weight: 334.842

Melting Point ($^{\circ}C$):

205-206 (Järnberg et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

273.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equations):

0.0015; 0.00121 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Lei et al. 1999)

$\log(P_L/Pa) = -4411/(T/K) + 11.97$ (GC-RT correlation, supercooled liquid, Lei et al. 1999)

0.00157 (supercooled liquid P_L , regression with GC-RT from literature, Lei et al. 1999)

$\log(P_L/Pa) = -4432/(T/K) + 12.06$ (regression with GC-RT from literature, Lei et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$ at $25^{\circ}C$ and the temperature dependence equations:

7.70; 6.79 (calibrated HPLC-RT correlation; HPLC-RT correlation, Lei et al. 2000)

$\log K_{ow} = 2.489 + 1556.37/(T/K)$; temp range $5-55^{\circ}C$ (temperature dependence HPLC-k' correlation, Lei et al. 2000)

6.77 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations:

9.70 (generator column-GC/MS, Harner & Bidleman 1998)

10.58, 10.01, 9.46, 8.84, 8.42 (10, 20, 30, 40, $50^{\circ}C$, generator column-GC/MS, Harner & Bidleman 1998)

$\log K_{OA} = -7.09 + 5003/(T/K)$; temp range: $10-50^{\circ}C$ (generator column-GC/MS, Harner & Bidleman 1998)

9.58; 9.45 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

4.1.4.2 2-Bromonaphthalene

Common Name: 2-Bromonaphthalene

Synonym: β -bromonaphthalene

Chemical Name: 2-bromonaphthalene

CAS Registry No: 580-13-2

Molecular Formula: $C_{10}H_7Br$

Molecular Weight: 207.067

Melting Point ($^{\circ}C$):

55.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

281.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

146.3 (Ruelle & Kesselring 1997)

170.9 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.97 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.498 (mp at $55.9^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

8.27 (Yalkowsky et al. 1983)

7.72 (calculated-molecular connectivity indices, Nirmalakhandan & Speece 1989)

3.80, 8.04, 15.76 (4, 25, $40^{\circ}C$, generator column-UV spec., Dickhut et al. 1994)

10.1 (calculated-TSA, Dickhut et al. 1994)

9.04 (calculated-group contribution method, Kühne et al. 1995)

8.06 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.501* ($25.15^{\circ}C$, solid I, transpiration method-GC, measured range 280.4–318.3 K, Verevkin 2003)

$\ln(P/P^{\circ}) = 314.110/R - 94001.596/R \cdot (T/K) - (41.6/R) \cdot \ln[(T/K)/298.15]$, where $P^{\circ} = 101.325$ kPa, gas constant $R = 8.31451$ J·K $^{-1}$ ·mol $^{-1}$ (solid I, vapor pressure eq. from transpiration measurement, temp range 280.4–318.3 K, Verevkin 2003)

5.72; 5.75, 5.57 (generator column-GC; calculated-group contribution method, estimated-TSA and K_{OW} , Doucette & Andren 1987)

5.72; 5.75, 5.85, 6.14, 5.81, 5.68 (generator column-GC; calculated- π const., HPLC-RT correlation, calculated-MW, calculated-MCI χ , calculated-TSA and K_{OW} , Doucette & Andren 1988b)

5.72 (HPLC-RT correlation, Gobas et al. 1988,)

5.72 (recommended, Sangster 1993)

4.67 (calculated-UNIFAC, Chen et al. 1993)

5.72 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

5.43 (guppy, lipid weight-based, Gobas et al. 1989)

4.19; 5.43 (flowing water system-whole weight of fish; lipid content, quoted, Lu et al. 1999)

3.825, 4.365 (calculated-MCI χ , K_{OW} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$\log k_1 = 3.35$ d^{-1} (guppy, Gobas et al. 1989)

$\log k_2 = -0.91$ d^{-1} (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

4.1.4.7 2,4,6-Tribromobiphenyl

Common Name: 2,4,6-Tribromobiphenyl

Synonym: PBB-30

Chemical Name: 2,4,6-tribromobiphenyl

CAS Registry No: 59080-33-0

Molecular Formula: $C_{12}H_7Br_3$

Molecular Weight: 390.896

Melting Point ($^{\circ}C$):

64 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

208.3 (Ruelle & Kesselring 1997)

254.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.414 (mp at $64^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.016 (generator column-GC, Gobas et al. 1988)

0.0131 (quoted, Chessells et al. 1992)

0.054 (calculated-MCI χ , Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.03 (HPLC-RT correlation, Gobas et al. 1988, 1989)

6.03; 4.78 (quoted; calculated-UNIFAC, Chen et al. 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

5.06 (guppy, lipid weight-based, Gobas et al. 1989)

3.97; 5.06 (flowing water system-whole weight of fish; lipid content, quoted, Lu et al. 1999)

4.408, 4.645 (calculated-MCI χ , K_{ow} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$\log k_1 = 3.05 d^{-1}$; $\log k_2 = -0.83 d^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

4.1.4.8 2,2',5,5'-Tetrabromobiphenyl

Common Name: 2,2',5,5'-Tetrabromobiphenyl

Synonym: PBB-52

Chemical Name: 2,2',5,5'-tetrabromobiphenyl

CAS Registry No: 59080-37-4

Molecular Formula: $C_{12}H_6Br_4$

Molecular Weight: 469.792

Melting Point ($^{\circ}C$):

144 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

224.4 (Ruelle & Kesselring 1997)

277.8 (calculated-Le Bas at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.068 (mp at $144^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00429 (generator column-GC, Gobas et al. 1988)

0.0545 (quoted, Chessells et al. 1992)

0.00409 (calculated-AQUAFAC, Myrdal et al. 1995)

0.00246 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.50 (HPLC-RT correlation, Gobas et al. 1988,)

4.88 (calculated-UNIFAC group contribution, Chen et al. 1993)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

6.16 (guppy, lipid weight-based, Gobas et al. 1989)

4.62; 6.16 (flowing water system-whole weight of fish; lipid content, quoted, Lu et al. 1999)

5.097; 6.16 (calculated-MCI χ , K_{ow} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$\log k_1 = 2.96 d^{-1}$; $\log k_2 = -2.02 d^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

4.1.4.9 2,2',4,5,5'-Pentabromobiphenyl

Common Name: 2,2',4,5,5'-Pentabromobiphenyl

Synonym:

Chemical Name: 2,2',4,5,5'-pentabromobiphenyl

CAS Registry No: 6788-96-4

Molecular Formula: $C_{12}H_5Br_5$

Molecular Weight: 548.688

Melting Point ($^{\circ}C$):

157 (Dickhut et al. 1994; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

301.1 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

45.44 (Doucette & Andren 1988)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0507 (mp at $157^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations.):

1.032×10^{-4} , 4.42×10^{-4} , 9.82×10^{-4} (4.9 , 25 , $40^{\circ}C$, generator column-GC/ECD, Doucette & Andren 1988a)

$S/(mol/L) = 1.52 \times 10^{-10} \exp(0.063 \cdot t/^{\circ}C)$ (generator column-GC, temp range $4-40^{\circ}C$, Doucette & Andren 1988a)

$\log x = -2374/(T/K) - 2.373$, temp range $4-40^{\circ}C$ (generator column-GC, Doucette & Andren 1988a)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

77.10 (generator column-GC Doucette & Andren 1987)

77.10; 8.76 (generator column-GC; HPLC-RT correlation, Doucette & Andren 1988b)

7.10 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

4.1.4.10 2,2',4,4',6,6'-Hexabromobiphenyl

Common Name: 2,2',4,4',6,6'-Hexabromobiphenyl

Synonym: 2,2',4,4',6,6'-HBB

Chemical Name: 2,2',4,4',6,6'-hexabromobiphenyl

CAS Registry No: 59261-08-4

Molecular Formula: $C_{12}H_4Br_6$

Molecular Weight: 627.584

Melting Point ($^{\circ}C$):

176 (Gobas et al. 1988; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

256.6 (Ruelle & Kesselring 1997)

324.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.033 (mp at $176^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.23×10^{-4} (generator column-GC, Gobas et al. 1988)

0.0210 (lit. mean, Chessells et al. 1992)

1.04×10^{-4} (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

8.033×10^{-6} (for hexabrominated biphenyl, GC-RT correlation, Watanabe & Tatsukawa 1989)

4.52×10^{-10} (quoted, Pijnenburg et al. 1995)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.50 (for hexabrominated biphenyl, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

7.20 (HPLC-RT correlation, Gobas et al. 1987, 1989)

7.20; 5.09 (quoted; calculated-UNIFAC group contribution, Chen et al. 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

5.85 (guppy, lipid weight-based, Gobas et al. 1989)

4.26 (calculated- K_{ow} , Chessells et al. 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$\log k_1 = 2.51 d^{-1}$; $\log k_2 = -2.15 d^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

4.1.4.11 Decabromobiphenyl

Common Name: Decabromobiphenyl

Synonym: PBB-209

Chemical Name:

CAS Registry No: 13654-09-6

Molecular Formula: $C_{12}Br_{10}$

Molecular Weight: 943.168

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

417.6 (calculated-Le Bas method at normal boiling point)

Heat of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$):

$> 1.33 \times 10^{-9}$ (GC-RT correlation, Watanabe & Tatsukawa 1989)

$< 7.4 \times 10^{-4}$ (quoted, Pijnenburg et al. 1995)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

8.58; 12.63, 9.36 (generator column-GC; calculated-group contribution method, estimated-TSA and K_{ow} , Doucette & Andren 1987)

8.58; 10.42, 13.87, 8.46, 8.69, 7.10 (generator column-GC; calculated- π const., HPLC-RT correlation, calculated-MW, calculated-MCI χ , calculated-TSA and K_{ow} , Doucette & Andren 1988b)

8.60 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

9,10-DMBA	9,10-Dimethylbenz[<i>a</i>]anthracene

TABLE 4.2.3

Suggested half-life classes of polynuclear aromatic hydrocarbons (PAHs) in various environment compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Indan	2	4	6	7
Naphthalene	2	4	6	7
1-Methyl-	2	4	6	7
2,3-Dimethyl-	2	4	6	7
1-Ethyl-	2	4	6	7
1,4,5-Trimethyl-	2	4	6	7
Biphenyl	3	4	5	6
Acenaphthene	3	5	7	8
Fluorene	3	5	7	8
Phenanthrene	3	5	7	8
Anthracene	3	5	7	8
Pyrene	4	6	8	9
Fluoranthene	4	6	8	9
Chrysene	4	6	8	9
Benz[<i>a</i>]anthracene	4	6	8	9
Benzo[<i>k</i>]fluoranthene	4	6	8	9
Benzo[<i>a</i>]pyrene	4	6	8	9
Perylene	4	6	8	9
Dibenz[<i>a,h</i>]anthracene	4	6	8	9

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,00
9	55000 (~ 6 years)	> 30,000

5.1 LIST OF CHEMICALS AND DATA COMPILATIONS

5.1.1 CHLOROALKANES AND CHLOROALKENES

5.1.1.1 Chloromethane (Methyl chloride)

Common Name: Chloromethane

Synonym: methyl chloride, monochloromethane

Chemical Name: chloromethane

CAS Registry No: 74-87-3

Molecular Formula: CH₃Cl

Molecular Weight: 50.488

Melting Point (°C):

−97.7 (Lide 2003)

Boiling Point (°C):

−24.09 (Lide 2003)

Density (g/cm³ at 20°C):

0.9159 (Dreisbach 1961; Horvath 1982; Weast 1982–83)

0.9214, 0.9111 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

55.0 (calculated-density, Wang et al. 1992)

50.6, 48.8, 54.3, 50.4 (exptl., Tyn and Calus method, Schroeder method, Le Bas method, Reid et al. 1987)

50.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

19.06, 21.45 (at 25°C, at normal boiling point, Dreisbach 1961)

18.92, 21.40 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.43 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

7400 (30°C at 1 atm, McGovern 1943)

5346 (gravitational method, Glew & Moelwyn-Hughes 1953)

6450 (20°C, Dean 1973)

7250 (20°C under 101.3 kPa pressure of CH₃Cl, McConnell et al. 1975; Pearson & McConnell 1975)

6270, 5380 (20, 25°C literature average at 760 mmHg, Dilling 1977)

5325* (summary of literature data, temp range 5–80°C, Horvath 1982)

4800 (Dean 1985)

6480 (30°C, quoted, Riddick et al. 1986)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

98048* (248.9 K, static-manometer, measured range 191.4–248.9 K, Messerly & Aston 1940)

101325* (−24.0°C, summary of literature data, temp range −99.58 to 24.0°C, Stull 1947)

559860 (interpolated from graph, temp range −50 to 60°C, McGovern 1943)

100800 (Glew & Moelwyn-Hughes 1953)

574500 (calculated-Antoine eq., Dreisbach 1959; 1961)

log (P/mmHg) = 6.99445 − 902.451/(243.63 + t/°C); temp range −80 to 3°C (Antoine eq. for liquid state, Dreisbach 1959; 1961)

$\log (P/\text{mmHg}) = 6.99445 - 902.451/(243.60 + t/^{\circ}\text{C})$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

1081* (29.43°C, concentration ratio, measured range 29.43–40.59°C, Swain & Thornton 1962)

539300 (20–25°C, calculated-Antoine eq., Weast 1972–73)

$\log (P/\text{mmHg}) = [-0.2185 \times 5375.3/(T/K)] + 7.546207$; temp range –99 to 137.5°C (Antoine eq., Weast 1972–73)

567900, 576300 (calculated-Antoine eq., Boublik et al. 1973)

$\log (P/\text{mmHg}) = 6.98762 - 899.739/(242.921 + t/^{\circ}\text{C})$; temp range –69.2 to –23°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)

$\log (P/\text{mmHg}) = 6.09349 - 948.582/(249.336 + t/^{\circ}\text{C})$; temp range –75.2 to 5°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)

574600 (selected lit., Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.16533 - 920.86/(245.58 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

$\log (P/\text{mmHg}) = 7.09349 - 948.58/(249.34 + t/^{\circ}\text{C})$; temp range –77 to –5°C (Antoine eq., Dean 1985, 1992)

572800 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.11935 - 902.451/(-29.55 + T/K)$; temp range 180–266 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.04835 - 869.887/(-33.773 + T/K)$; temp range 247–310 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.94638 - 1448.913/(47.966 + T/K)$; temp range 308–373 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.94022 - 1447.601/(48.385 + T/K)$; temp range 368–416 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 25.7264 - 1.7503 \times 10^3/(T/K) - 6.7151 \cdot \log (T/K) - 1.2956 \times 10^{-9} \cdot (T/K) + 4.4341 \times 10^{-6} \cdot (T/K)^2$; temp range 175–416 K (vapor pressure eq., Yaws 1994)

498820 (293.15 K, selected summary of literature data, temp range 175.44–293.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

953*, 957 (distribution ratio, measured range 4–80°C; calculated-P/C, Glew & Moelwyn-Hughes 1953)

$\log \{H/(\text{mmHg} \cdot \text{L/mol})\} = 71.005 - 21.656 \cdot \log (T/K) - 4043.9/(T/K)$; temp range 277.24–353.23 K (Glew & Moelwyn-Hughes 1953)

1010 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

744, 892 (exptl. as per McConnell et al. 1975, calculated-P/C, Neely 1976)

739 (20°C, Pearson & McConnell 1975)

942 (calculated- C_A/C_W , Dilling 1977)

875 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)

$\log (k_H/\text{atm}) = 6.93 - 1248.11/(T/K)$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)

951, 950 (calculated-P/C, recommended, Mackay & Shiu 1981)

894* (EPICS-GC/FID, measured range 10.3–34.6°C, Gossett 1987)

$\ln [H/(\text{atm m}^3/\text{mol})] = 9.358 - 4215/(T/K)$, temp range: 10.3–34.6°C (EPICS measurements, Gossett 1987)

669 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

867 (computed value, Yaws et al. 1991)

363, 834 (0, 22°C, distilled water, headspace-GC, Elliot & Rowland 1993)

386 (0°C, gas stripping-GC, Moore et al. 1995)

392, 465, 533 (0, 3.0, 6.0°C, seawater of salinity of 30.4‰, gas stripping-GC, Moore et al. 1995)

$\ln K_{AW} = 9.17 - 2982/(T/K)$, seawater of salinity of 30.4‰, temp range: 0–6°C (Moore et al. 1995)

668 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)

743 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)

$\log K_{AW} = 3.899 - 1292/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.91 (shake flask-GC, Hansch et al. 1975; Hansch & Leo 1979)

0.91 (shake flask, Log P Database, Hansch & Leo 1987)

0.89, 0.936 (calculated-MO, calculated- π substituent const., Bodor et al. 1989)

0.91 (recommended, Sangster 1989)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

1.39 (calculated-measured γ^∞ in pure octanol and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

0.505 (microorganism-water, calculated from K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

0.633 (calculated- K_{OW} , Mabey et al. 1982)

0.778 (selected, Jury et al. 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: half-life of 27–28 min for initial concentration of 1 mg/L in an open container stirred at 200 rpm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982);

Evaporation $t_{1/2}(\text{exptl.}) = 27.6$ min, $t_{1/2}(\text{calc}) = 0.599$ min, 14.9 min from water (Dilling 1977)

$t_{1/2} \sim 2.4$ h from water (estimated, Thomas 1982);

$t_{1/2} \sim 120$ d from soil (estimated, Jury et al. 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or Arrhenius expression see reference:

$k_{OH} = 4.7 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, bimolecular rate constant (Yung et al. 1975)

$k_{OH} = 8.5 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, bimolecular rate constant with a lifetime $\tau = 0.37$ yr in the troposphere (Cox et al. 1976)

$k_{OH}^* = (4.29 \pm 0.21) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 250–350 K, with a tropospheric lifetime of 1.19 yr (flash photolysis-resonance fluorescence, Davis et al. 1976)

$k_{OH}^* = (4.29 \pm 0.21) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K with lifetime $\tau = 1.19$ yr, measured range 250–350 K (flash photolysis-resonance fluorescence, Davis et al. 1976; quoted, Altshuller 1980)

$k_{OH} = (3.6 \pm 0.8) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow-LMR, Howard & Evenson 1976a)

$k_{OH}^* = (4.4 \pm 0.5) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.4 K, measured range 298–423 K and the calculated $t_{1/2} \sim 0.2$ yr in lower troposphere (flash photolysis-RF, Perry et al. 1976)

$k_{OH} = 24.7 \times 10^9 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 297 K (flash photolysis-resonance absorption, Paraskevopoulos et al. 1981)

$k_{OH} = 5.0 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 231 d, loss of 0.4% in 1d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{OH}^* = 3.95 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 293 K, measured range 247–483 K (discharge-flow resonance fluorescence, Jeong & Kaufman, 1982)

$k_{OH}(\text{calc}) = 2.4 \times 10^{10} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (Lyman 1982)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $0.05 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982)

$k_{OH}^* = 4.36 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{OH}^* = 4.9 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 295–800 K (laser photolysis/laser induced fluorescence technique, Taylor et al. 1989)

$k_{NO_3} = 9.8 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Atkinson 1991)

Hydrolysis: $k = 6.8 \times 10^{-5} \text{ h}^{-1}$ with hydrolytic $t_{1/2} = 417$ d at pH 7 and 25°C (Radding et al. 1977; Mabey & Mill 1978; quoted, Callahan et al. 1979; Mabey et al. 1982);

hydrolysis $k = 2.3710^{-8} \text{ h}^{-1}$ with $t_{1/2} 0.93$ yr (Mabey & Mill 1978)

$t_{1/2} = 7000$ h, based on neutral and base catalyzed hydrolysis rate constants at 25°C extrapolated from data obtained at higher temperatures (Mabey & Mill 1978; quoted, Howard et al. 1991).

Biodegradation:

$t_{1/2}(\text{aq. aerobic}) = 168\text{--}672$ h, based on unacclimated aerobic aqueous screening test data for dichloromethane from experiments utilizing selected domestic waste water inoculum (Tabak et al. 1981; quoted, Howard et al. 1991) and activated sludge inoculum (Klecka 1982; quoted, Howard et al. 1991);

$t_{1/2}(\text{aq. anaerobic}) = 672\text{--}2688$ h, based on estimated aerobic biodegradation half-life (Howard et al. 1991)

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (Darnall et al. 1976);
tropospheric lifetime of 1.19 yr due to reaction with OH radical (Davis et al. 1976);
estimated residence time to be about 2 yr for the reaction with OH radical in troposphere (Singh et al. 1979);
lifetime $\tau = 1.19$ yr for reaction with OH radical (Altshuller 1980)
residence time of 231 d, loss of 0.4% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)
estimated residence time in troposphere to be 1 yr (Lyman 1982);
 $t_{1/2} = 1472\text{--}14717$ h, based on photooxidation half-life in air from measured rate constants for reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);
estimated tropospheric lifetimes of 1.3 yr, and 1.54 yr by rigorous calculation (Nimitz & Skaggs 1992).
lifetime for reaction with OH radicals, $\tau = 11.7$ yr for Polar region, $\tau = 2.2$ yr for Middle region and $\tau = 0.8$ yr for Tropical region in the Northern hemisphere; $\tau = 0.9$ yr for Tropical, $\tau = 3.6$ yr for Middle and $\tau = 12.3$ yr for Polar region in the Southern hemisphere; $\tau = 1.4$ yr in the Global atmosphere, based on data from 1981–1996 (Khalil & Rasmussen 1999a)
Surface water: $t_{1/2} = 168\text{--}672$ h, based on estimated aerobic biodegradation half-life (Howard et al. 1991).
Ground water: $t_{1/2} = 336\text{--}1344$ h, based on estimated aerobic biodegradation half-life (Howard et al. 1991).
Sediment:
Soil: $t_{1/2} > 50$ d (Ryan et al. 1988); estimated $t_{1/2} = 120$ d for volatilization from soil (Jury et al. 1990);
 $t_{1/2} = 168\text{--}672$ h, based on estimated aerobic biodegradation half-life (Howard et al. 1991).
Biota: $t_{1/2} > 50$ d, subject to plant uptake from soil via volatilization (Ryan et al. 1988).

TABLE 5.1.1.1.1

Reported aqueous solubilities and Henry's law constants of chloromethane (methyl chloride) at various temperatures

$$S/(\text{wt}\%) = 1.4019 - 6.3562 \times 10^{-2} \cdot (t/^{\circ}\text{C}) + 1.71977 \times 10^{-3} \cdot (t/^{\circ}\text{C})^2 - 2.8262 \times 10^{-5} \cdot (t/^{\circ}\text{C})^3 + 2.5268 \times 10^{-7} \cdot (t/^{\circ}\text{C})^4 - 9.3470 \times 10^{-10} \cdot (t/^{\circ}\text{C})^5 \quad (1)$$

5.1.1.2 Dichloromethane

Common Name: Dichloromethane

Synonym: methylene chloride, methylene dichloride, methane dichloride, methylene bichloride

Chemical Name: dichloromethane

CAS Registry No: 75-09-2

Molecular Formula: CH_2Cl_2

Molecular Weight: 84.933

Melting Point ($^{\circ}\text{C}$):

-95.2 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

40 (Lide 2003)

Density (g/cm^3 at 20°C):

1.3255, 1.3163 (20°C , 25°C , Dreisbach 1959; 1961)

1.3266 (Horvath 1982; Weast 1982–83)

1.3256, 1.131678 (20°C , 25°C , Riddick et al. 1986)

Molar Volume (cm^3/mol):

64.0 (calculated-density, Wang et al. 1992)

71.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

28.56, 28.98 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

1.435 (calculated, Dreisbach 1959; 1961)

1.472 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0 (Suntio et al. 1988)

Water Solubility (g/m^3 or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

20000* (20°C , volumetric method, Rex 1906)

19910 (Seidell 1940)

13200 (25°C , data presented between 0 – 50°C in graph, McGovern 1943)

34480 (shake flask-residue volume method, Booth & Everson 1948)

13200 (20°C , McConnell et al. 1975; Pearson & McConnell 1975)

20000* (Archer & Sterns 1977; Andelman 1978; measured range 0 – 30°C , quoted, Horvath 1982)

22700, 19400 (1.5, 20°C , literature average, Dilling 1977)

13700 (shake flask-titration/turbidity, Coca et al. 1980)

13030* (summary of literature data, Horvath 1982)

13000 (selected, Thomas 1982; Riddick et al. 1986; Howard 1990)

16700 (Verschueren 1983; selected, Valsaraj 1988)

19020 (calculated-UNIFAC activity coeff., Banerjee 1985)

17200* (26.8°C , shake flask-GC/TC, measured range 0 – 35.7°C , Stephenson 1992)

19260, 19830, 19500, 19500 (20, 30, 35, 40°C , infinite dilution activity coeff. γ° -GC, Tse et al. 1992)

18080, 19995, 20880, 21850 (20, 30, 35, 40°C , infinite dilution activity coeff. γ° -UNIFAC, Tse et al. 1992)

20080, 18800, 18880 (10, 20, 30°C , activity coeff. γ° -differential pressure transducer, Wright et al. 1992)

18650 (gas stripping-GC, Li et al. 1993)

20340 (20°C , limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

46510, 68170 (20°C , 30°C , Rex 1906)

57120 (interpolated from graph, temp range -40 to 110°C , McGovern 1943)

- 57480* (Antoine eq. regression, temp range -70 to 40.7°C , Stull 1947)
 58100 (calculated-Antoine eq., Dreisbach 1959; 1961)
 $\log(P/\text{mmHg}) = 7.07138 - 1134.6/(231.0 + t/^{\circ}\text{C})$; temp range -28 to 121°C (Antoine eq. for liquid state, Dreisbach 1955)
 49704* (21.199°C , temp range -9.03 to 39.429°C , Boublik 1960; quoted, Boublik et al. 1984)
 70530* (29.993°C , temp range 29.993 – 39.993°C , Mueller & Ignatowski 1960)
 $\log(P/\text{mmHg}) = 7.0803 - 1138.91/(231.45 + t/^{\circ}\text{C})$; temp range -28 to 73°C (Antoine eq. for liquid state, Dreisbach 1961)
 57390 (calculated-Antoine eq., temp range -70 to 40.7°C , Weast 1972–73)
 $\log(P/\text{mmHg}) = [-0.2185 \times 7572.3/(T/\text{K})] + 8.18330$; temp range -70 to 40.7°C (Antoine eq., Weast 1972–73)
 58275, 57270 (calculated-Antoine eq., Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 9.72567 - 2979.516/(395.553 + t/^{\circ}\text{C})$; temp range 30 – 40°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 48200 (20°C , McConnell et al. 1975; Pearson & McConnell 1975)
 21065, 57062 (1.5 , 25°C , Dow Chemicals data, Dilling 1977)
 57950, 57980 (calculated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 5.96841 - 1014.441/(216.227 + t/^{\circ}\text{C})$; temp range 30 – 40°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.18791 - 1127.232/(229.764 + t/^{\circ}\text{C})$; temp range -9.05 to 38.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 47990 (selected, Daniels et al. 1985)
 $\log(P/\text{mmHg}) = 7.4092 - 1325.9/(252.6 + t/^{\circ}\text{C})$; temp range -40 to 40°C (Antoine eq., Dean 1985, 1992)
 58100 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.07622 - 1070.07/(223.24 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 57990 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_1/\text{kPa}) = 6.18649 - 1126.53/(-43.46 + T/\text{K})$; temp range 264 – 312 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_1/\text{kPa}) = 6.88926 - 1545.323/(3.375 + T/\text{K})$; temp range 311 – 383 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_1/\text{kPa}) = 5.87285 - 861.817/(-94.102 + T/\text{K})$; temp range 379 – 455 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log(P_1/\text{kPa}) = 5.20540 - 449.586/(-193.701 + T/\text{K})$; temp range 450 – 510 K (Antoine eq., Stephenson & Malanowski 1987)
 47660, 71000, 85640, 102540 (20 , 30 , 35 , 40°C , quoted from DIPPR, Tse et al. 1992)
 $\log(P/\text{mmHg}) = 32.5069 - 2.5166 \times 10^3/(T/\text{K}) - 8.8015 \cdot \log(T/\text{K}) + 1.2934 \times 10^{-10} \cdot (T/\text{K}) + 3.3194 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 178 – 510 K (vapor pressure eq., Yaws 1994)
 57844 (selected summary of literature data, temp range 178.25 – 338.15 K, Xiang 2002)
 70486 (30°C , vapor-liquid equilibrium study, Pathare et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 231.3 (calculated as $1/K_{\text{AW}} C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)
 301.0 (McConnell et al. 1975; Pearson & McConnell 1975)
 322.3 (calculated, Neely 1976)
 292, 271.5 (exptl., calculated- $C_{\text{A}}/C_{\text{W}}$, Dilling 1977)
 111.3 (20°C , calculated- P/C , Kavanaugh & Trussell 1980)
 $\log(k_{\text{H}}/\text{atm}) = 7.92 - 1821.84/(T/\text{K})$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)
 295 (equilibrium cell-concn ratio-GC/FID, Leighton & Calo 1981)
 295* (24.9°C equilibrium cell-concn ratio-GC/FID, measured range 1.9 – 24.9°C Leighton & Calo 1981)
 $\ln(k_{\text{H}}/\text{atm}) = 17.42 - 3645/(T/\text{K})$; temp range 1.9 – 24.9°C (equilibrium cell-concn ratio measurements, Leighton & Calo 1981)
 205.7 (calculated- P/C , Mabey et al. 1982)
 303.9 (calculated- P/C , Thomas 1982)

 244.1 (modified EPICS method-GC, Ryu & Park 1999)
 260; 221; 211 (EPICS-GC; quoted lit.; calculated-P/C, David et al. 2000)
 220 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 4.561 - 1644/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 1.25 (shake flask-GC, Hansch et al. 1975; Hansch & Leo 1979; Hansch & Leo 1985)
 1.51 (Hansch & Leo 1979)
 1.22 (HPLC- k' correlation, Hafkenscheid & Tomlinson 1983)
 1.25 (HPLC- k' correlation, Tomlinson & Hafkenscheid 1986)
 1.25 (recommended, Sangster 1989)
 1.35* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
 1.25 (recommended, Hansch et al. 1995)
 1.25 (calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 2.27 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 0.699 (calculated as per Lyman et al. 1982, Howard 1990)
 0.778 (microorganism-water, calculated from K_{OW} , Mabey et al. 1982)
 0.600 (calculated-MCI χ , Koch 1983)
 0.362 (selected, Daniels et al. 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

- 0.944 (calculated- K_{OW} , Mabey et al. 1982)
 1.440 (calculated- MCI χ , Koch 1983; quoted, Bahnick & Doucette 1988)
 1.000 (selected, Daniels et al. 1985)
 1.390 (calculated-MCI χ , Bahnick & Doucette 1988)

Sorption Partition Coefficient, $\log K_{OM}$:

- 1.44, 1.23 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, and Half-Lives, $t_{1/2}$:

- Volatilization: $t_{1/2}(\text{calc}) = 2.23$ min (Mackay & Wolkoff 1973; quoted, Dilling et al. 1975; Callahan et al. 1979);
 $t_{1/2}(\text{calc}) = 20.7$ min (Mackay & Leinonen 1975; quoted, Dilling 1977; Callahan et al. 1979);
 $t_{1/2}(\text{exptl}) = (21 \pm 3)$ min for 1 ppm in water at 25°C when stirred at 200 rpm in water (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982);
 evaporation $t_{1/2}(\text{exptl}) = (18.3\text{--}25.2)$ min, $t_{1/2}(\text{calc}) = 2.23$ and 20.7 min at 25°C and $t_{1/2}(\text{exptl.}) = 34.9$ min, $t_{1/2} = 24.5$ min at 1.5°C (Dilling 1977)
 $t_{1/2} \sim 3.0$ h from water (estimated, Thomas 1982);
 $t_{1/2} \sim 100$ d from soil (estimated, Jury et al. 1990).
- Photolysis: estimated photodecomposition $t_{1/2} > 250$ h from a simulated environmental sunlight exposure (> 290 nm at $27 \pm 1^\circ\text{C}$) study (Dilling et al. 1976; quoted, Callahan et al. 1979);
 photodegradation $t_{1/2} = 30\text{--}120$ d (Darnall et al. 1976; quoted, Daniels et al. 1985);
 photocatalyzed mineralization by the presence of TiO_2 with a rate of 1.6 ppm/min per gram of catalyst (Ollis 1985).
- Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:
 $k_{\text{OH}} = 1.24 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K corresponding to a lifetime of 0.30 yr (relative rate method, Cox et al. 1976; quoted, Callahan et al. 1979)
 $k_{\text{OH}}^* = (1.16 \pm 0.05) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K with lifetime of 0.39 yr, measured range 245–375 K (flash photolysis-resonance fluorescence, Davis et al. 1976)
 $k_{\text{OH}} = 1.55 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (discharge flow-LMR, Howard & Evenson 1976a)
 $k_{\text{OH}} = (14.5 \pm 2.0) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.5 K and the calculated tropospheric half-life of ~ 0.05 yr in lower troposphere (flash photolysis-RF, Perry et al. 1976)
 $k_{\text{OH}} = 1.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 77 d, loss of 1.3% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)
 $k_{\text{OH}}^* = 1.53 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 292 K, measured range 251–455 K (discharge flow-resonance fluorescence, Jeong & Karfman 1982)
 $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $0.2 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)
 $k \leq 0.1 \text{ M}^{-1} \text{ s}^{-1}$ for reaction with O_3 in water as scavenger at pH 2 and 20–23°C (Hoigné & Bader 1983)
 photooxidation $t_{1/2} = 458\text{--}4584$ h based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)
 $k = 4.0 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ with reference to CH_3CCl_3 (Buxton et al. 1988; quoted, Haag & Yao 1992)
 $k_{\text{OH}} = 1.42 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 9.6 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)
 $k_{\text{OH}}^* = 1.42 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)
 $k_{\text{OH}}^* = 1.76 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 298–775 K (laser photolysis/laser induced fluorescence technique, Taylor et al. 1989)
 $k = (9 \pm 6) \times 10^7 \text{ M}^{-1} \text{ h}^{-1}$ for the reaction with OH radical in aqueous solution at pH 8.5 (Haag & Yao 1992)
- Hydrolysis: a minimum hydrolysis $t_{1/2} = 18$ months was estimated from aqueous reactivity experiments (Dilling et al. 1975; quoted, Callahan et al. 1979; Howard 1990);
 rate constant $k = 3.2 \times 10^{-11} \text{ s}^{-1}$ with a maximum $t_{1/2} = 704$ yr for hydrolysis at pH 7 and 25°C was reported from the extrapolated experimental data obtained at 100–150°C (Radding et al. 1977; quoted, Callahan et al. 1979; Mabey et al. 1982)
 $t_{1/2} = 260000$ d in natural waters at pH 7 (Capel & Larson 1995)
- Biodegradation: completely biodegradable under aerobic conditions with sewage seed or activated sludge between 6 h to 7 d (Rittman & McCarty 1980; Davis et al. 1981; Tabak et al. 1981; Klecka 1982; Stover & Kincannon 1983; quoted, Howard 1990)
 $t_{1/2}(\text{aq. aerobic}) = 168\text{--}672$ h based on unacclimated aerobic screening test data (Kawasaki 1980; Tabak et al. 1981; quoted, Howard et al. 1991); $t_{1/2}(\text{aq. anaerobic}) = 672\text{--}2688$ h based on unacclimated aerobic biodegradation half-life (Howard et al. 1991).
 $t_{1/2}(\text{aerobic}) = 7$ d, $t_{1/2}(\text{anaerobic}) = 28$ d in natural waters (Capel & Larson 1995)
- Biotransformation:
 Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 33$ wk when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 2.4$ –24 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976)

lifetime of 4.4 yr in troposphere for the reaction with OH radical (Altshuller 1980)

estimated disappearance time to be 12 h to 1.0 year in simulated troposphere chamber (Dilling & Goersch 1979; quoted, Lyman 1982)

residence time of 77 d, loss of 1.3% in 1 d or 12 sunlit hours at 300 K in urban environments estimated as toxic chemical for the reaction with OH radical (Singh et al. 1981)

estimated residence time in troposphere to be 160–250 d (Lyman 1982);

$t_{1/2} = 458$ –4584 h, based on photooxidation half-life in air (Atkinson 1985; quoted, Howard et al. 1991)

Surface water: estimated $t_{1/2} = 33$ –38 d in various locations in the Netherlands in case of a first order reduction process (Zoeteman et al. 1980)

$t_{1/2} = 168$ –672 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

biodegradation $t_{1/2}$ (aerobic) = 100 d, $t_{1/2}$ (anaerobic) = 400 d, hydrolysis $t_{1/2} = 3800$ d at pH 7 in natural waters (Capel & Larson 1995)

$t_{1/2} = 1$ –1.2 d for the first days up to 4 d and 2.71–2.80 d for a period of up to 14 d for disappearance from water calculated from a pseudo first order equation of mesocosms experiment (Merlin et al. 1992)

Ground water: estimated for the first days up to 4 d and $t_{1/2} = 2.71$ –2.80 d for a period of up to 14 d of 10 yr in the ground water of The Netherlands (Zoeteman et al. 1981)

$t_{1/2} = 336$ –1344 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 10$ –50 d (Ryan et al. 1988);

volatilization $t_{1/2} \sim 100$ d from soil (Jury et al. 1990);

biodegradation $t_{1/2}$ (aerobic) = 1.3 d (0.16 ppm, conc of dichloromethane), $t_{1/2} = 9.4$ d (0.5 ppm), $t_{1/2} = 191.4$ d (5 ppm), all in sandy loam soil; $t_{1/2} = 54.8$ d in sand (0.5 ppm); $t_{1/2} = 12.7$ d (0.5 ppm) in sandy clay loam soil; $t_{1/2} = 7.2$ d (0.5 ppm) in clay with 50 d lag and $t_{1/2}$ (anaerobic) = 21.5 d (5 ppm) with 70 d lag (Davis & Madsen 1991);

$t_{1/2} = 168$ –672 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $t_{1/2} = 10$ –50 d, subject to plant uptake in soil via volatilization (Ryan et al. 1988);

$t_{1/2} = 0.4$ –0.5 d to eliminate from small fish (McCarty et al. 1992).

TABLE 5.1.1.2.1

Reported aqueous solubilities of dichloromethane at various temperatures

$$S/(\text{wt}\%) = 1.961 - 4.4883 \times 10^{-2} \cdot (t/^\circ\text{C}) + 8.6617 \times 10^{-4} \cdot (t/^\circ\text{C})^2 + 4.9463 \times 10^{-6} \cdot (t/^\circ\text{C})^3 \quad (1)$$

5.1.1.3 Trichloromethane (Chloroform)

Common Name: Trichloromethane

Synonym: chloroform, trichloromethaneq

Chemical Name: trichloromethane

CAS Registry No: 67-66-3

Molecular Formula: CHCl_3

Molecular Weight: 119.378

Melting Point ($^{\circ}\text{C}$):

−63.41 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

61.17 (Lide 2003)

Density (g/cm^3 at 20°C):

1.4832 (Dreisbach 1961; Horvath 1982; Weast 1982–83)

1.49845, 1.48911, 1.47970 (15, 20, 25°C , Riddick et al. 1986)

Molar Volume (cm^3/mol):

80.0 (calculated-density, Mailhot 1987; Wang et al. 1992)

92.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

33.35, 29.37 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol)

8.80 (calculated, Dreisbach 1959)

9.54 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

8220, 7760 (20°C , 30°C , volumetric method, Rex 1906)

8520, 7710 (15, 30°C , shake flask-interferometer, Gross & Saylor 1931)

8000 (Wright & Schaffer 1932)

7361 (Seidell 1940)

7700 (Seidell 1941)

7900 (data presented from 0 – 50°C in graph, McGovern 1943)

13320 (shake flask-residue volume method, Booth & Everson 1948)

8000 (20°C , Stephen & Stephen 1963)

8150 (20°C , Riddick & Bunger 1970)

8200 (20°C , Pearson & McConnell 1975)

8000 (20°C , Neely 1976; Verschueren 1977)

10300, 7840 (1.5, 25°C , selected, Dilling 1977)

7230 (shake flask-LSC, Banerjee et al. 1980)

11900 (shake flask-titration/turbidity, Coca et al. 1980)

7360 (shake flask-LSC, Veith et al. 1980)

7920* (summary of literature data, temp range 0 – 60°C , Horvath 1982)

2525 (30°C , headspace-GC, McNally & Grob 1984)

7190 (calculated-UNIFAC activity coeff., Banerjee 1985)

8200 (shake flask-radiometric method, Lo et al. 1986)

8150 (20°C , selected, Riddick et al. 1986)

8080, 7435, 7290 (20, 35, 50°C , infinite dilution activity coeff. γ^{∞} -GC, Barr & Newsham 1987)

8670 (23 – 24°C , shake flask-GC, Broholm et al. 1992)

8200*, 7900 (19.6°C , 29.5°C , shake flask-GC/TC, measured range 0 – 59.2°C , Stephenson 1992)

7280, 8118, 8558, 9011 (20, 30, 35, 40°C, infinite dilution activity coeff. γ^∞ -UNIFAC, Tse et al. 1992)
 8108, 7030, 7694 (20, 35, 50°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 7345 (gas stripping-GC, Li et al. 1993)
 8098 (20°C, activity coeff. by inert air stripping-GC, Hovorka & Dohnal 1997)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

21115, 31990 (20°C, 30°C, Rex 1906)
 39345* (35.0°C, vapor-liquid equilibrium, measured range 35.0–60.0°C, Scatchard & Raymond 1938)
 26660 (interpolated from graph, temp range –30 to 170°C, McGovern 1943)
 25700* (interpolated-Antoine eq. regression, temp range –58.0 to 61.3°C, Stull 1947)
 26310 (calculated-Antoine eq., Dreisbach 1959)
 $\log(P/\text{mmHg}) = 6.90328 - 1163.0/(227.0 + t/^\circ\text{C})$; temp range –15 to 90°C (Antoine eq. for liquid state, Dreisbach 1959)
 $\log(P/\text{mmHg}) = 6.93708 - 1171.2/(227.0 + t/^\circ\text{C})$; temp range –13 to 97°C (Antoine eq. for liquid state, Dreisbach 1961)
 25780* (24.598°C, temp range –10.356 to 60.319°C, Boublik & Aim 1972; quoted, Boublik et al 1984)
 23080 (interpolated from Antoine eq., temp range –58 to 254°C, Weast 1972–73)
 $\log(P/\text{mmHg}) = [-0.2185 \times 7500.5/(T/K)] + 7.735083$; temp range –58 to 254°C (Antoine eq., Weast 1972–73)
 26240, 18950 (calculated-Antoine eq., Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 6.85465 - 1170.966/(226.252 + t/^\circ\text{C})$; temp range (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 6.4934 - 959.444/(196.03 + t/^\circ\text{C})$; temp range (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 26217, 26104 (static method-differential pressure gauge, Bissell & Williamson 1975)
 20000 (20°C, Pearson & McConnell 1975)
 25590 (literature average, Dilling 1977)
 21330 (20°C, Verschueren 1983)
 26220, 32080 (calculated-Antoine eq., Boublik et al. 1984)
 21330 (20°C, quoted, McNally & Grob 1984)
 $\log(P/\text{mmHg}) = 6.4934 - 929.44/(196.03 + t/^\circ\text{C})$; temp range –36 to 61°C (Antoine eq., Dean 1985, 1992)
 25970 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 5.96288 - 1106.94/(218.552 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 26220 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.07853 - 1170.42/(-46.98 + T/K)$; temp range 262–334 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 5.38327 - 948.979/(-61.73 + T/K)$; temp range 227–269 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.11152 - 1173.606/(-48.54 + T/K)$; temp range 333–416 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 7.89882 - 2879.244/(-161.978 + T/K)$; temp range 410–481 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 4.58922 - 181.802/(-325.74 + T/K)$; temp range 479–523 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = 56.6178 - 3.2462 \times 10^3/(T/K) - 18.7 \cdot \log(T/K) + 9.515 \times 10^{-3} \cdot (T/K) + 1.1553 \times 10^{-12} \cdot (T/K)^2$; temp range 210–536 K (vapor pressure eq., Yaws 1994)
 26182 (selected summary of literature data, temp range 209.64–368.15 K, Xiang 2002)
 32408 (30°C, vapor-liquid equilibrium VLE data, Pathare et al. 2004)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

314.1 (20°C, Dilling et al. 1975)
 440.8 (calculated as $1/K_{AW}$, C_W/C_A , Hine & Mookerjee 1975)
 283.4 (20°C, McConnell et al. 1975; Pearson & McConell 1975)
 310 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)

- $\log(k_H/\text{atm}) = 9.10 - 2103.09/(T/K)$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)
 373* (equilibrium cell-concn ratio-GC/FID, Leighton & Calo 1981)
 $\ln(k_H/\text{atm}) = 18.97 - 4046/(T/K)$; temp range 1.9–24.9°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 292.0 (20°C, calculated-P/C, Mabey et al. 1982; Mills et al. 1982)
 536.9 (batch stripping-GC, Munz & Roberts 1982; Roberts & Dändliker 1983; Roberts et al. 1985)
 432.2 (calculated-UNIFAC activity coeff., Arbuckle 1983)
 $\ln K_{AW} = 10.63 - 3649/(T/K)$; measured range 5–33°C (seawater, multiply equilibrium-GC, Hunter-Smith et al. 1983)
 298 (calculated-P/C, Jury et al. 1984; Jury et al. 1990)
 337.4; 308 (20°C, EPICS-GC; batch air stripping-headspace GC, Lincoff & Gossett 1984)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 8.553 - 4180/(T/K)$; temp range 10–30°C (EPICS measurements, Lincoff & Gossett 1984)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 8.956 - 4322/(T/K)$, temp range 10–30°C (batch air stripping measurements, Lincoff & Gossett 1984)
 304; 314; 486, 365 (20°C, batch air stripping-GC; calculated-P/C; quoted lit. values, Nicholson et al. 1984)
 334, 294, 314 (20°C, batch stripping-GC, natural potable water samples, Nicholson et al. 1984)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 11.90 - 5200/(T/K)$; temp range 10–30°C (air stripping-GC, Nicholson et al. 1984)
 343.4 (adsorption isotherm, Urano & Murata 1985)
 372* (EPICS-GC, measured range 9.6–34.6°C, Gossett 1987)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 9.843 - 4612/(T/K)$; temp range 9.6–34.6°C (EPICS measurements, Gossett 1987)
 334 (EPICS-GC, Munz & Roberts 1987)
 $\log K_{AW} = 4.990 - 1729/(T/K)$, temp range 10–30°C (EPICS-GC measurements, Munz & Roberts 1987)
 343 (gas stripping-GC, Warner et al. 1987)
 427; 387; 372; 374; 399 (EPICS-GC; calculated-P/C; EPICS; direct concn ratio; calculated-UNIFAC activity coefficient, Ashworth et al. 1988)
 427* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 11.41 - 5030/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 294 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 318 (calculated-P/C, Suntio et al. 1988; Mackay & Shiu 1990)
 411 (computed value, Yaws et al. 1991)
 199.3* (26.5°C, tap water, EPICS-GC, measured range 26.5–47.2°C, Tancrede & Yanagisawa 1990)
 $\log K_{AW} = 9.154 - 3051/(T/K)$; temp range 26.5–47.2°C (EPICS measurements, Tancrede & Yanagisawa 1990)
 306, 592, 1046 (20, 35, 50°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 362 (activity coefficient γ^∞ from gas stripping-GC, Li et al. 1993)
 514, 513 (35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 379* (EPICS-GC/FID, measured range 2.0–25°C, Dewulf et al. 1995)
 177, 444 (6.0, 25°C, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
 $\ln K_{AW} = -4142/(T/K) + 0.00588 \cdot Z + 12.012$; with Z salinity of 0–35.5‰ and temp range 2–35°C, (EPICS-GC/FID, Dewulf et al. 1995)
 212, 341 (10, 20°C, gas stripping-GC, Moore et al. 1995)
 126, 214, 352 (0, 10, 20°C, seawater of salinity of 30.4‰, gas stripping-GC, Moore et al. 1995)
 $\ln K_{AW} = 11.17 - 3840/(T/K)$; seawater of salinity of 30.4‰, temp range: 0–20°C (Moore et al. 1995)
 261, 451 (15, 25°C, vapor liquid equilibrium-GC, Turner et al. 1996)
 $K_{AW} = 0.0394 + 0.00486 \cdot (T/K)$; temp range 0–60°C (vapor-liquid equilibrium-GC measurements with additional lit. data, Turner et al. 1996)
 312 (20°C, inert air stripping-GC, Hovorka & Dohnal 1997)
 331.2 (20°C, exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)
 370.8 (modified EPICS method-GC, Ryu & Park 1999)
 411; 260 (EPICS-GC; calculated-P/C, David et al. 2000)
 307 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 5.343 - 1830/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)
 704.5 (37°C, equilibrium headspace-GC, Batterman et al. 2002)
 408* (EPICS-SPME, measured range 2–60°C, Görgényi et al. 2002)
 $\ln K_{AW} = 10.96 - 3821.3/(T/K)$; temp range 2–60°C (EPICS-SPME method, Görgényi et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated

* are compiled at the end of this section:

- 1.97 (Hansch & Anderson 1967)
- 1.97 (shake flask-UV, Hansch et al. 1968; Leo et al. 1971; Hansch et al. 1975)
- 1.94 (Hansch & Leo 1979)
- 1.90 (shake flask-LSC, Banerjee et al. 1980)
- 1.90 (shake flask-LSC, Veith et al. 1980)
- 1.81 (HPLC- k' correlation, McDuffie 1981)
- 2.15 (HPLC- k' correlation, Wells et al. 1981)
- 1.91 (calculated-UNIFAC activity coeff., Arbuckle 1983)
- 1.90 (HPLC- k' correlation, Hafkenscheid & Tomlinson 1983)
- 2.14, 2.13, 2.03 (HPLC- k' correlation, Tomlinson & Hafkenscheid 1986)
- 1.66 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)
- 1.97 (recommended, Sangster 1989)
- 2.00* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
- 1.86* (24.8°C, EPICS-GC, measured range 2.2–24.8°C, Dewulf et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 2.80 (equilibrium head-space-GC, Abraham et al. 2001)
- 2.55; 2.53 (equilibrium headspace-GC; calculated- K_{OW}/K_{AW} , Batterman et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 0.92 (calculate- K_{OW} , Veith et al. 1979; quoted, Veith et al. 1980)
- 0.78 (bluegill sunfish, Barrows et al. 1980; Bysshe 1982)
- 0.78 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1982; quoted, Davies & Dobbs 1984; Suntio et al. 1988; Isnard & Lambert 1988; Saito et al. 1992)
- 0.63 (calculated- K_{OW} , Mackay 1982)
- 1.41 (microorganisms-water, calculated from K_{OW} , Mabey et al. 1982)
- 0.97 (calculated-MCI χ , Koch 1983)
- 0.78 (bluegill sunfish, LSC, Davies & Dobbs 1984)
- 2.84 (green algae, Mailhot 1987)
- 2.84 (*Selenastrum capricornutum*, Mailhot 1987)
- 0.52–1.01; 0.204–0.40; 0.46–0.49; 0.552–0.57 (rainbow trout; bluegill sunfish; large mouth bass; catfish, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 1.64 (calculated- K_{OW} , Mabey et al. 1982)
- 1.65 (calculated-MCI χ , Koch 1983)
- 2.15 (wastewater solids with correlation to K_{OW} , Dobbs et al. 1989)
- 1.44 (20°C, soil, sand and loess, sorption isotherm-headspace method, Grathwohl 1990)
- 1.98 (20°C, weathered shale, mudrock, sorption isotherm-headspace method, Grathwohl 1990)
- 2.79 (20°C, unweathered shale and mudrock, sorption isotherm-headspace method, Grathwohl 1990)
- 1.85, 1.92 (20°C, calculated- K_{OW} , Grathwohl 1990)
- 1.53 (soil, Howard 1990)
- 1.46 (selected, Jury et al. 1990)
- 1.57; 1.46; 1.54 (Captina silt loam, OC 1.49%, pH 4.97; McLaurin sandy loam, OC 0.66%, pH 4.43; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)
- 1.63, 1.65, 1.63, 1.66, 1.69, 1.65, 1.70 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, Belgium, organic carbon $f_{OC} = 4.12\%$, EPICS-GC/FID, Dewulf et al. 1999)

Sorption Partition Coefficient, $\log K_{OM}$:

- 1.65, 1.40 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: calculated $t_{1/2} = 1.4$ min (Mackay & Wolkoff 1973);

primary transport process from the aquatic environment with $t_{1/2} = 21$ –26 min at pH 7 and 25°C stirred at 200 rpm in an open container (Dilling et al. 1975)

evaporation rate $k(\text{exptl}) = 13.2 \times 10^{-5} \text{ g cm}^{-2} \text{ s}^{-1}$ to still air (Chiou & Freed 1977; Chiou et al. 1980)

evaporation $t_{1/2}(\text{exptl}) = (8.5\text{--}25.7)$ min, $t_{1/2}(\text{calc}) = 1.46, 2.37$ min at 20–25°C, $t_{1/2}(\text{exptl}) = 34.6$ min at 1.5°C (Dilling 1977)

$t_{1/2} = 3$ –5.6 h for different laboratory studies of evaporation from water with moderate mixing conditions (Smith et al. 1980; Rathbun & Tai 1981; Lyman et al. 1982; quoted, Howard 1990);

$t_{1/2} = 1.2$ d in Rhine River and $t_{1/2} = 31$ d in a lake in Rhine Basin. (Zoeteman et al. 1980).

$t_{1/2} \sim 3.7$ h from water (estimated, Thomas 1982);

$t_{1/2} = 29$ min–11.3 d from rivers and streams, calculated using published O_2 reaeration values; and $t_{1/2}(\text{calc}) = 31.2$ h from rivers and streams, calculated using estimated O_2 reaeration rate constant (Kaczmar et al. 1984);

predicted $t_{1/2} = 36$ h in a river, $t_{1/2} = 40$ h in a pond and $t_{1/2} = 9$ –10 d in a lake (USEPA 1984; quoted, Howard 1990);

$t_{1/2} = 4$ h at 20°C was predicted from a model river of 1 m deep at flowing speed of 1 m/s with a wind velocity of 3 m/s and its Henry's law constant (Smith et al. 1980; quoted, Howard 1990);

Photolysis: not important only by UV in the stratosphere (Robbins 1976);

probably not significant in aquatic systems (Callahan et al. 1979);

photocatalyzed mineralization by the presence of TiO_2 with a rate of $4.4 \text{ ppm min}^{-1} \text{ g}^{-1}$ of catalyst (Ollis 1985).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}} = 1.01 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (discharge flow-LMR, Howard & Evenson 1976a)

$k_{\text{OH}}^* = 1.14 \times 10^{-13} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 298 K with lifetime of 0.56 yr, measured range 245–375 K (flash photolysis-resonance fluorescence, Davis et al. 1976; quoted, Altshuller 1980)

troposphere with $t_{1/2} = 0.19$ –0.32 yr due to reaction with OH radical (Callahan et al. 1979)

$k_{\text{OH}} = 1.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 116 d, loss of 0.9% in 1d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{\text{OH}}^* = 1.01 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 249–487 K (discharge flow-resonance fluorescence, Jeong & Kaufman 1982)

$k_{\text{OH}} = 6.6 \times 10^{10} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ of estimated at 300 K (Lyman 1982)

$t_{1/2} = 78.5$ –3140 yr from the rate constant for the reaction with OH radical (estimated, Dorfman & Adams 1973)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $0.7 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical both at 25°C (Mabey et al. 1982)

$k \leq 0.1 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

photooxidation $t_{1/2} = 26$ –260 d, based on measured data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k = 4.0 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ with reference to CH_3CCl_3 (Buxton et al. 1988; quoted, Haag & Yao 1992)

$k_{\text{OH}} = 1.03 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 1.8 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{\text{OH}}^* = 1.03 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 295–775 K (laser photolysis/laser induced fluorescence technique, Taylor et al. 1989)

$k = (5.4 \pm 3.0) \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution at pH 8.5 (Haag & Yao 1992)

$k_{\text{OH}}^* = 1.03 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis: first-order rate constant $k = 0.045 \text{ mo}^{-1}$ with $t_{1/2} \sim 15$ months (Dilling et al. 1975; quoted, Callahan et al. 1979);

$k = 6.9 \times 10^{-12} \text{ s}^{-1}$ (Radding 1976);

hydrolysis rate constant $k = 6.9 \times 10^{-12} \text{ s}^{-1}$ with $t_{1/2} = 3500$ yr at 25°C and pH 7 (Mabey & Mill 1978)

no hydrolysis in acidic aqueous solutions, and rate constant in alkaline aqueous solution, $k = 0.23 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C, and $k = 2.5 \times 10^{-9} \text{ M}^{-1} \text{ h}^{-1}$ at 25°C in neutral aqueous solutions (Mabey & Mill 1978; Mabey et al. 1982; Mills et al. 1982);

probably not a significant fate process with $t_{1/2} = 3500$ yr, based on reported rate constant $k = 6.9 \times 10^{-12} \text{ s}^{-1}$ at pH 7 and 25°C (Mabey & Mill 1978; quoted, Callahan et al. 1979; Haque et al. 1980).

Biodegradation: very slow by BOD bottle experiments (Pearson & McConnell 1975);

$t_{1/2}$ (aq. aerobic) = 4 wk to 6 months by unacclimated screening tests (Kawasaki 1980; Flathman & Dahlgran 1982; quoted, Howard et al. 1991);

$t_{1/2}$ (aq. anaerobic) = 1–4 wk by unacclimated anaerobic screening tests (Bouwer et al. 1981; Bouwer & McCarty 1983; quoted, Howard et al. 1991);

$k = 0.5 \text{ d}^{-1}$ (Tabak et al. 1981; Mills et al. 1982).

Bioaccumulation: weak to moderate bioaccumulation; no evidence of biomagnification of trichloromethane in marine food chain (Callahan et al. 1979).

Bioconcentration, Uptake(k_1) and Elimination(k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 23$ wk when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 2.4$ –24 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

residence time of 1.7 yr in troposphere, based on one compartment nonsteady state model (Singh et al. 1978; quoted, Lyman 1982);

residence time of 116 d, loss of 0.9% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

estimated residence time in N. troposphere to be 100 d (Lyman 1982);

$t_{1/2} = 623$ –6231 h, based on photooxidation half-life in air from measured reaction data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);

tropospheric lifetime ~ 0.17 yr (estimated, Nimitz & Skaggs 1992)

lifetime for reaction with OH radicals, $\tau = 3.0$ yr for Polar region, $\tau = 0.6$ yr for Middle region and $\tau = 0.2$ yr for Tropical region in the Northern hemisphere; $\tau = 0.3$ yr for Tropical, $\tau = 1.0$ yr for Middle and $\tau = 3.2$ yr for Polar region in the Southern hemisphere; $\tau = 0.5$ yr in the Global atmosphere, based on data from 1985–1996 (Khalil & Rasmussen 1999b)

Surface water: not important for aqueous phase (Dilling et al. 1975);

$t_{1/2} = 1.0$ –31 d in various location in the Netherlands in case of a first order reduction process (estimated, Zoeteman et al. 1980)

$t_{1/2} = 672$ –4320 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344$ –43200 h, based on unacclimated aqueous aerobic biodegradation and grab sample data of aerobic soil from a ground water aquifer (Wilson et al. 1983; quoted, Howard et al. 1991).

Soil: $t_{1/2} = 10$ –50 d (Ryan et al. 1988);

$t_{1/2} = 100$ d, estimated volatilization loss from soil (Jury et al. 1990)

disappearance $t_{1/2} = 4.1$ d was calculated from first order kinetic for volatilization loss from soil mixtures (Anderson et al. 1991);

$t_{1/2} = 672$ –4320 h, based on estimated aqueous aerobic biodegradation (Howard et al. 1991).

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980);

$t_{1/2} = 10$ –50 d, subject plant uptake via volatilization (Ryan et al. 1988).

TABLE 5.1.1.3.1

Reported aqueous solubilities of trichloromethane at various temperatures

$$S/(\text{wt}\%) = 0.995 - 1.0531 \times 10^{-2} \cdot t/^{\circ}\text{C} + 7.9819 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 + 6.6431 \times 10^{-7} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

5.1.1.4 Tetrachloromethane (Carbon tetrachloride)

Common Name: Carbon tetrachloride

Synonym: tetrachloromethane, methane tetrachloride, perchloromethane, benzinofom

Chemical Name: tetrachloromethane

CAS Registry No: 56-23-5

Molecular Formula: CCl_4

Molecular Weight: 153.823

Melting Point ($^{\circ}\text{C}$):

-22.62 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

76.8 (Lide 2003)

Density (g/cm^3 at 20°C):

1.594 (McGovern 1943; Dreisbach 1959, 1961; Weast 1982–83; Horvath 1982; Riddick et al. 1986)

1.6037, 1.59402, 1.58436 (15, 20, 25°C , Riddick et al. 1986)

Molar Volume (cm^3/mol):

113.2 (calculated-Le Bas method at normal boiling point)

96.0 (calculated-density, Wang et al. 1992)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

32.41, 29.96 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

0.775 (calculated, Dreisbach 1959)

0.581 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

800, 850 (20°C , 30°C , volumetric method, Rex 1906)

 $\ln [H/(\text{atm}\cdot\text{m}^3/\text{mol})] = 9.739 - 3951/(T/K)$; temp range $10\text{--}30^\circ\text{C}$ (EPICS measurements, Ashworth et al. 1988)
 2330 ($20\text{--}25^\circ\text{C}$ and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 2980 (computed value, Yaws et al. 1991)
 2990 (EPICS-GC, Tancréde et al. 1992)
 2875* (tap water, EPICS-GC, measured range $25\text{--}47.2^\circ\text{C}$, Tancréde & Yanagisawa 1990)
 $\log K_{\text{AW}} = 5.569 - 1639/(T/K)$; temp range: $25\text{--}47.2^\circ\text{C}$ (EPICS measurements, Tancréde & Yanagisawa 1990)
 2067, 3415, 3871, 4580 ($20, 30, 35, 40^\circ\text{C}$, infinite dilution activity coeff. $\gamma\text{-GC}$, Tse et al. 1992)
 2646, 4392, 6624 ($20, 35, 50^\circ\text{C}$, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 3133* (27.6°C , EPICS-GC, measured range $27.6\text{--}45^\circ\text{C}$, Hansen et al. 1993)
 $\ln [H/(\text{kPa}\cdot\text{m}^3/\text{mol})] = -3553/(T/K) + 13.0$; temp range $27\text{--}45^\circ\text{C}$ (EPICS measurements, Hansen et al. 1993)
 4.04, 6.0 ($35, 50^\circ\text{C}$, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 2598* (EPICS-GC/FID, measured range $2.0\text{--}25^\circ\text{C}$, Dewulf et al. 1995)
 1341, 3370 ($6.0, 25^\circ\text{C}$, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
 $\ln K_{\text{AW}} = -4073/(T/K) + 0.00814\cdot Z + 13.772$; with Z salinity $0\text{--}35.5\text{‰}$, temp range: $2\text{--}35^\circ\text{C}$ (EPICS-GC/FID, Dewulf et al. 1995)
 2352 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 1996)
 2612 (modified EPICS method-GC, Ryu & Park 1999)
 2313 (20°C , selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 5.736 - 1689/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 2.64 (Leo et al. 1971)
 2.62 (shake flask-GC, Chiou et al. 1977)
 2.83 (shake flask, Hansch & Leo 1979, 1987)

- 2.73 (shake flask-LSC, Banerjee et al. 1980)
- 2.73 (shake flask-LSC, Veith et al. 1980)
- 2.94 (HPLC- k' correlation, McDuffie 1981)
- 2.81, 290 (calculated from UNIFAC activity coeff. with octanol and water mutual solubility considered, not considered, Arbuckle 1983)
- 2.83 (HPLC- k' correlation, Hafkenscheid & Tomlinson 1983)
- 2.03 (HPLC correlation, Eadsforth 1986)
- 2.73 (HPLC- k' correlation, Tomlinson & Hafkenscheid 1986)
- 2.38 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)
- 2.83 (recommended, Sangster 1989)
- 2.83 (recommended, Hansch et al. 1995)
- 2.73* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
- 2.38* (24.8°C, EPICS-GC, measured range 2.2–24.8°C, Dewulf et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 2.79 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 1.24 (rainbow trout, Neely et al. 1974; Veith et al. 1979)
- 1.25 (trout muscle, calculated-ratio of rate const. k_1/k_2 , Neely et al. 1974)
- 1.48 (bluegill sunfish, Barrows et al. 1980; Veith et al. 1980; Veith & Kosian 1982)
- 2.32 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
- 1.72 (rainbow trout, Veith & Kosian 1982)
- 2.68 (activated sludge, Freitag et al. 1984)
- 2.48 (*alga chlorella fusca*-LSC, Geyer et al. 1984)
- 2.68, 2.48, < 1.0 (activated sludge, *Chlorella fusca*, golden ide, Freitag et al. 1985)
- 2.06 (calculated- K_{OW} , $S_{OCTANOL}$, and mp, Banerjee & Baughman 1991)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 2.04 (calculated-S as per Kenaga & Goring 1980, Kenaga 1980)
- 2.64 (calculated- K_{OW} , Mabey et al. 1982)
- 1.85 (calculated-MCI χ , Koch 1983)
- 1.70 (calculated-MCI χ , Bahnick & Doucette 1988)
- 1.26, 1.34, 1.70, 1.96, 2.07 (DTMA-clay, TTMA-clay, HTMA-clay, BDHA-clay, DDPA-clay, Smith et al. 1990)
- 1.69 (80% DTMA-clay at 20°C, Smith & Jaffé 1991)
- 2.16; 1.70; 2.06 (Captina silt loam, OC 1.49%, pH 4.97; McLaurin sandy loam, OC 0.66%, pH 4.43, weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)
- 2.20, 2.24, 2.24, 2.25, 2.28, 2.27, 2.33 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, Belgium, organic carbon $f_{OC} = 4.12\%$, EPICS-GC/FID, Dewulf et al. 1999)%o
- 1.80, 1.80, 1.78 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, average, Delle Site 2001)
- 2.01, 2.00, 2.02 (sediments: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, average, Delle Site 2001)

Sorption Partition Coefficient, $\log K_{OM}$:

- 1.55 (calculated-MCI χ , Sabljic 1984)
- 1.89, 1.72 (Florida peat, OC 57.1%; Michigan muck, OC 53.1%, batch equilibrium-sorption equilibrium, Rutherford & Chiou 1992; Rutherford et al. 1992)
- 0.243, 1.866 (cellulose, extracted peat, Rutherford et al. 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization: $t_{1/2} = 29$ min was determined in an open container with initial concentration of 1 mg/L when stirred at 100 rpm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982; Verschueren 1983);
- Evaporation $t_{1/2}(\text{exptl}) = 28.8$ min, $t_{1/2}(\text{calc}) = 0.2$ min, 25.5 min from water (Dilling 1977);

ratio of evaporation rate constant to that of oxygen reaeration: 0.47 as measured value compared to 0.43 as predicted (Smith et al. 1980);

$k < 2.4 \times 10^8 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, estimated rate constant for the reaction with OH radical at 300 K (Lyman 1982);
 $t_{1/2} \sim 3.7 \text{ h}$ from a model river of 1 m deep for water flowing at 1 m/s with wind speed of 3 m/s and Henry's law constant (Thomas 1982; Lyman et al. 1982; quoted, Howard 1990).

Photolysis: photocatalyzed mineralization by the presence of TiO_2 with the rate of 0.18 ppm/min per gram of catalyst (Ollis 1985).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} < 1.25 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (relative rate method, Cox et al. 1976)

$k_{\text{OH}} = 1 \times 10^{-16} \text{ cm}^3 \text{ s}^{-1}$ bimolecular reaction rate, with a reported tropospheric lifetime of greater than 330 yr (Cox et al. 1976; quoted, Callahan et al. 1979)

$k_{\text{OH}} < 0.1 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (discharge flow-LMR, Howard & Evenson 1976a)

$k_{\text{OH}} < 1.0 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time $> 11600 \text{ d}$, loss $\approx 0.0\%$ in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{\text{OH}}(\text{calc}) \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$k \leq 0.005 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983)

photooxidation half-life in air: $1.6 \times 10^4 \text{--}1.6 \times 10^5 \text{ h}$, based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k < 2 \times 10^6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution (Haag & Yao 1992)

$k_{\text{OH}} < 5 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis: hydrolysis rate constant $k = 4.8 \times 10^{-7} \text{ s}^{-1}$ with $t_{1/2} = 7000 \text{ yr}$ (1 ppm), $t_{1/2} = 7 \text{ yr}$ (1000 ppm) at 25°C and pH 7 (Mabey & Mill 1978)

calculated first-order $t_{1/2} = 7000 \text{ yr}$, based on reported rate constant $k = 4.8 \times 10^{-7} \text{ mol}^{-1} \text{ s}^{-1}$ for 1 mg/L concentration at pH 7 and 25°C (Mabey & Mill 1978; quoted, Callahan et al. 1979; Howard 1990; Howard et al. 1991)

$t_{1/2} = 2,600,000 \text{ d}$ at pH 7 in natural waters (Capel & Larson 1995)

Biodegradation: $t_{1/2}(\text{aq. aerobic}) = 4320\text{--}8640 \text{ h}$, based on acclimated aerobic screening test data (Tabak et al. 1981; quoted, Howard et al. 1991);

$t_{1/2}(\text{aq. anaerobic}) = 168\text{--}672 \text{ h}$, based on unacclimated anaerobic screening test data (Bouwer & McCarty 1983; quoted, Howard et al. 1991) and acclimated anaerobic sediment/aquifer grab sample data (Parsons et al. 1985; quoted, Howard et al. 1991).

$t_{1/2}(\text{aerobic}) = 170 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 7 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: estimated rate constant of $1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria in water (Mabey et al. 1982).

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 4.05 \text{ h}^{-1}$; $k_2 = 0.229 \text{ h}^{-1}$ (trout muscle, Neely et al. 1974; quoted, Thomann 1989)

$k_1 = 4.05 \text{ mL g}^{-1} \text{ h}^{-1}$ (10°C , trout gill, Neely 1979)

$k_1 = 4.10 \text{ h}^{-1}$; $k_2 = 0.25 \text{ h}^{-1}$ (trout, Hawker & Connell 1985)

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 10 \text{ wk}$, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} > 10 \text{ d}$ for the reaction with OH radical in air (Darnall et al. 1976);

estimated residence time in troposphere, $> 330 \text{ yr}$ (CEQ 1975);

estimated residence time of 100 yr in troposphere (Singh et al. 1979);

residence time $> 11600 \text{ d}$, loss $\approx 0.0\%$ in 1 d or 12 sunlit hours at 300 K in urban environments estimated as toxic chemical for the reaction with OH radical (Singh et al. 1981)

estimated residence time of 4–20 yr in troposphere (Lyman 1982);

$t_{1/2} = 30\text{--}50 \text{ yr}$ residence time in the troposphere (Howard 1990);

$t_{1/2} = 1.6 \times 10^4 \text{--}1.6 \times 10^5 \text{ h}$, based on photooxidation half-life in air from measured rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991).

Surface water: estimated $t_{1/2} = 0.4\text{--}56 \text{ d}$ in various locations in the Netherlands in case of a first order reduction process; $t_{1/2} \sim 3\text{--}30 \text{ d}$ in rivers and $t_{1/2} = 3\text{--}300 \text{ d}$ in lakes (Zoeteman et al. 1980);

$t_{1/2} = 4320\text{--}8640 \text{ h}$, based on estimated aqueous aerobic biodegradation (Howard et al. 1991).

$t_{1/2}(\text{aerobic}) = 170 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 7 \text{ d}$ in natural waters (Capel & Larson 1995)

Ground water: estimated $t_{1/2} \sim 3\text{--}300$ d (Zoeteman et al. 1980; quoted, Howard 1990);

$t_{1/2} = 168\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life and acclimated anaerobic sediment/aquifer grab sample data (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{calc}) = 50$ d in soil mixtures from first-order kinetic (Anderson et al. 1991).

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980).

TABLE 5.1.1.4.1

Reported aqueous solubilities of tetrachloromethane at various temperatures

$$S/(\text{wt}\%) = 9.7842 \times 10^{-2} - 1.4942 \times 10^{-3} \cdot (t/^{\circ}\text{C}) + 3.5854 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 + 2.2775 \times 10^{-7} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

5.1.1.5 Chloroethane (Ethyl chloride)

Common Name: Ethyl chloride

Synonym: chloroethane, monochloroethane

Chemical Name: chloroethane, ethyl chloride, monochloroethane, hydrochloric ether, muriatic ether

CAS Registry No: 75-00-3

Molecular Formula: C_2H_5Cl , CH_3CH_2Cl

Molecular Weight: 64.514

Melting Point ($^{\circ}C$):

-138.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

12.30 (McGovern 1943; Weast 1982–83; Dean 1985; Howard 1990; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8978 (Weast 1982–83)

0.92390, 0.8960, 0.88981 (0, 20, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

72.0 (calculated-density, Wang et al. 1992)

72.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

27.8, 24.652 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

4.45 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

5735 ($12.5^{\circ}C$, shake flask, Fühner 1924)

7580 (Seidell 1940)

4500 ($0^{\circ}C$, McGovern 1943; Dean 1985)

5710 ($20^{\circ}C$, Neely 1976)

5700 ($20^{\circ}C$, selected, Dilling 1977)

5678* ($20^{\circ}C$, summary of literature data, Horvath 1982)

5740 ($20^{\circ}C$, Verschuere 1977, 1983)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

136630 (data presented in graph, temp range -50 to $\sim 105^{\circ}C$, McGovern 1943)

187000* (extrapolated-Antoine eq. regression, summary of literature data, Stull 1947)

101436* ($12.51^{\circ}C$, static method-Hg manometer, measured range -55.88 to $12.51^{\circ}C$, Gordon & Giauque 1948)

160000 (calculated-Antoine eq., Dreisbach 1959)

$\log (P/mmHg) = 6.94914 - 1012.77/(236.47 + t/^{\circ}C)$; temp range -50 to $70^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1959)

$\log (P/mmHg) = 6.94914 - 1012.77/(236.67 + t/^{\circ}C)$, pressure range of 10 to 1500 mmHg, (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log (P/mmHg) = [-0.2185 \times 6310.6/(T/K)] + 7.660205$; temp range -89.8 to $180.5^{\circ}C$ (Antoine eq., Weast 1972–73)

160000 (calculated-Antoine eq., Boublik et al. 1973)

$\log (P/mmHg) = 6.98647 - 1030.007/(238.612 + t/^{\circ}C)$; temp range -55.94 to $12.5^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1973)

149400 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.11833 - 1033.161/(236.956 + t/^{\circ}C)$; temp range -55.94 to $12.5^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 6.98647 - 1030.01/(238.61 + t/^{\circ}\text{C})$; temp range -56 to 12.2°C (Antoine eq., Dean 1985, 1992)
 159880 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.09088 - 1020.63/(237.57 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 160000 (calculated-Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.07404 - 1012.771/(-36.48 + T/\text{K})$; temp range 207 – 305 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.14258 - 1053.998/(-30.686 + T/\text{K})$; temp range 285 – 344 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.4495 - 1248.788/(-3.798 + T/\text{K})$; temp range: 334 – 413 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.70739 - 1465.734/(29.696 + T/\text{K})$; temp range 403 – 460 K (Antoine eq., Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 28.3448 - 2.0788 \times 10^3/(T/\text{K}) - 7.5387 \cdot \log (T/\text{K}) - 1.6384 \times 10^{-11} \cdot (T/\text{K}) + 4.055 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 137 – 460 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

860 (calculated as $1/K_{\text{AW}}$, $C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)
 1140 (calculated, Dilling 1977)
 1145 (calculated-P/C, Mackay & Shiu 1981, 1990)
 1125* (24.8°C , EPICS-GC/FID, measured range 10.3 – 34.6°C , Gossett 1987)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 5.974 - 3120/(T/\text{K})$; temp range: 10.3 – 34.6°C (EPICS measurements, Gossett 1987)
 1226* (EPICS-GC/FID, measured range 10 – 30°C , Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 4.265 - 2580/(T/\text{K})$; temp range 10 – 30°C (EPICS measurements, Ashworth et al. 1988)
 1270 (calculated-QSAR, Nirmalakhandan & Speece 1988)
 942 (20 – 25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 701 (computed value, Yaws et al. 1991)
 1019 (20°C , selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{\text{AW}} = 3.406 - 1110/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.54 (Leo et al. 1971)
 1.39 (calculated- π substituent const., Hansch et al. 1968; Hansch & Leo 1979)
 1.43 (shake flask-GC, Hansch et al. 1975; Hansch & Leo 1987)
 1.43 (recommended, Sangster 1989, 1993)
 1.43 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

0.86, 0.67 (estimated- K_{OW} , S, Lyman et al. 1982; quoted, Howard et al. 1990)
 0.99 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

2.16, 1.52 (estimated- K_{OW} , S, Lyman et al. 1982; quoted, Howard 1990)
 1.17 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 1.40 (soil, selected, Jury et al. 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental $t_{1/2} = 21$ min for 1 mg/L to evaporate from aqueous solution stirred at 200 rpm in an open container of depth 65 mm at 25°C (Dilling et al. 1975);
 Evaporation $t_{1/2}(\text{exptl}) = 23.1$ min, $t_{1/2}(\text{calc}) = 0.5$ min, 16.7 min from water (Dilling 1977);
 volatilization $t_{1/2} = 2.5$ h from a model river of 1 m deep, based on Henry's law constant (Lyman et al. 1982; quoted, Howard 1990);

$t_{1/2} = 5.6, 1.1,$ and 4.5 d from representative pond, river and lake were estimated based on oxygen reaeration ratio of 0.645 (Mabey et al. 1982; quoted, Howard 1990);

$t_{1/2} = 30$ d for volatilization loss from soil (Jury et al. 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{OH} = (3.9 \pm 0.7) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K and the calculated lifetime of about 2.6×10^8 s or 30 d (discharge flow-laser magnetic resonance, Howard & Evenson 1976b; quoted, Callahan et al. 1979; Altshuller 1980)

$k_{OH} = (2.37 \pm 0.32) \times 10^9 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ or $(3.94 \pm 0.53) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 297 K (flash photolysis-resonance fluorescence, Paraskevopoulos et al. 1978)

$k_{OH} = 2.3 \times 10^{11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, estimated at 300 K (Lyman 1982)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982)

$k_{O_3} = 2.0 \times 10^{-23} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–323 K (quoted, Atkinson & Carter 1984) photooxidation half-life of 160–1604 h, based on measured rate constants for the reaction with OH radical in air (Atkinson 1985; quoted, Howard 1990; Howard et al. 1991)

$k_{OH} = 3.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH}^* = (4.08 \pm 0.31) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294.8 K, measured range 294.8–788.7 K (laser photolysis/laser induced fluorescence, Kasner et al. 1990)

Hydrolysis: $k = 2.0 \times 10^{-7} \text{ s}^{-1}$ was estimated for reaction at pH 7 and 25°C with a maximum $t_{1/2} = 40$ d (Radding et al. 1977; quoted, Callahan et al. 1979; Mabey et al. 1982);

$k = 2.10 \times 10^{-7} \text{ s}^{-1}$ with $t_{1/2} = 38$ day at 25°C and pH 7 (Mabey & Mill 1978)

estimated $t_{1/2} = 38$ d at 25°C was based on an exptl $t_{1/2} = 1.68$ h at 100°C with ethanol and HCl being the hydrolysis product (Mabey & Mill 1978; quoted, Haque et al. 1980; Howard 1990; Howard et al. 1991);

$k = 4.5 \times 10^{-5} \text{ h}^{-1}$ at pH 7 and 25°C with a calculated $t_{1/2} = 1.8$ yr (Jeffers et al. 1989; quoted, Ellington 1989); abiotic hydrolysis or dehydrohalogenation $t_{1/2} = 1.3$ month (Olsen & Davis 1990).

Biodegradation:

$t_{1/2}(\text{aq. aerobic}) = 168\text{--}672$ h, based on aqueous aerobic screening test data for 1-chloropropane and 1-chlorobutane (Gerhold & Malaney 1966; quoted, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 672\text{--}2688$ h, based on estimated unacclimated aqueous aerobic half-life (Howard et al. 1991)

$k = 0.02 \text{ yr}^{-1}$ with $t_{1/2} = 10$ d and $k = 0.001 \text{ yr}^{-1}$ with $t_{1/2} = 700$ d (Olsen & Davis 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

calculated lifetime of about 2.6×10^8 s or 30 d (Howard & Evenson 1976b; quoted, Callahan et al. 1979; Altshuller 1980);

$t_{1/2} = 160\text{--}1604$ h, based on photooxidation half-life in air from measured rate constants for the gas phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);

estimated tropospheric lifetime of 0.04 yr (Nimitz & Skaggs 1992).

Surface water: $t_{1/2} = 168\text{--}672$ h, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 336\text{--}1344$ h, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 10\text{--}50$ d (Ryan et al. 1988);

$t_{1/2} = 30$ d, volatilization loss from soil (Jury et al. 1990);

$t_{1/2} = 168\text{--}672$ h, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991).

Biota: $t_{1/2} = 10\text{--}50$ d, subject to plant uptake by soil through volatilization (Ryan et al. 1988).

TABLE 5.1.1.5.1

5.1.1.6 1,1-Dichloroethane

Common Name: 1,1-Dichloroethane

Synonym: ethylidene chloride, ethylidene dichloride

Chemical Name: 1,1-dichloroethane

CAS Registry No: 75-34-3

Molecular Formula: $C_2H_4Cl_2$, CH_3CHCl_2

Molecular Weight: 98.959

Melting Point ($^{\circ}C$):

−96.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

57.3 (Weast 1982–83, Dean 1985; Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1757 (Dreisbach 1961; Horvath 1982; Weast 1982–83; Dean 1985)

1.1755, 1.1679 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

84.0 (calculated-density, Abernethy et al. 1988; Wang et al. 1992)

93.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

30.62, 28.6 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.87 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

5500* ($20^{\circ}C$, volumetric method, measured range 0 – $30^{\circ}C$, Rex 1906)

5240, 5317, 5406 (20 , 30 , $40^{\circ}C$, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

6560, 7300, 8085 (20 , 30 , $40^{\circ}C$, infinite dilution activity coeff. γ^{∞} -UNIFAC, Tse et al. 1992)

4998, 4434, 5236 (20 , 35 , $45^{\circ}C$, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

5196* ($20^{\circ}C$, activity coeff. by inert air stripping-GC, measured range 10 – $50^{\circ}C$, Hovorka & Dohnal 1997)

5040* (recommended, temp range 0 – $50^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(wt\%) = 9.4136 - 5.7249 \times 10^{-2} \cdot (T/K) + 9.17839 \times 10^{-5} \cdot (T/K)^2$, temp range 273 – $323 K$ (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

24300, 37000 ($20^{\circ}C$, $30^{\circ}C$, Rex 1906)

- 30000* (Antoine eq. regression, temp range -60.7 to 57.4°C, Stull 1947)
 22001* (17.62°C, static-Hg manometer, measured range -38.76 to 17.62°C, Li & Pitzer 1956)
 30400 (calculated-Antoine eq., Dreisbach 1961)
 $\log (P/\text{mmHg}) = 6/9853 - 1171.42/(228.12 + t/^\circ\text{C})$; temp range -15 to 82°C (Antoine eq. for liquid state, Dreisbach 1961)
 26000 (calculated-Antoine eq., Weast 1972-73)
 $\log (P/\text{mmHg}) = [-0.2185 \times 7288.0/(T/K)] + 7.629952$; temp range -60.7 to 261.5°C (Antoine eq., Weast 1972-73)
 30260 (calculated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 6.97702 - 1174.022/(229.06 + t/^\circ\text{C})$; temp range -38.8 to 17.6°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 30260 (Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.10983 - 1177.636/(229.409 + t/^\circ\text{C})$; temp range -38.8 to 17.5°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 6.9971 - 1174.02/(229.08 + t/^\circ\text{C})$; temp range -39 to 16°C (Antoine eq., Dean 1985, 1992)
 30360 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.16780 - 1201.05/(231.27 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 30360 (calculated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.1102 - 1171.42/(-45.03 + T/K)$; temp range 258-365 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.14443 - 1216.12/(-36.569 + T/K)$; temp range 323-535 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.22839 - 1288.092/(-24.381 + T/K)$; temp range 363-535 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 24440, 37240 54990 (20, 30, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log (P/\text{mmHg}) = 33.380 - 2.6102 \times 10^3/(T/K) - 9.1336 \cdot \log (T/K) - 2.8838 \times 10^{-11} \cdot (T/K) + 3.7323 \times 10^{-6} \cdot (T/K)^2$; temp range 176-523 K (vapor pressure eq., Yaws 1994)
 $\log (P/\text{kPa}) = 6.110022 - 1171.420/(T/K - 45.03)$ (from database of CData 1991, Hovorka & Dohnal 1997)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 595 (calculated-1/K_{AW} (C_W/C_A) reported as exptl., Hine & Mookerjee 1975)
 595 (calculated-P/C, Dilling 1977)
 $\log (k_H/\text{atm}) = 8.87 - 1902.37/(T/K)$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)
 569* (EPICS-GC/FID, measured range 9.6-34.6°C, Gossett 1987)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 9.637 - 4128/(T/K)$; temp range 9.6-34.6°C (EPICS measurements, Gossett 1987)
 552 (gas stripping-GC, Warner et al. 1987)
 633* (EPICS-GC/FID, measured range 10-30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 5.484 - 3137/(T/K)$; temp range 10-30°C (EPICS measurements, Ashworth et al. 1988)
 436 (20-25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 584 (calculated-P/C, Mackay & Shiu 1990)
 595 (computed value, Yaws et al. 1991)
 436 (20°C, quoted from Gossett 1987, Tse et al. 1992)
 466, 709, 1034 (20, 30, 40°C, infinite dilution activity coeff. γ -GC, Tse et al. 1992)
 477, 995, 1226 (20, 35, 45°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 588, 1125, 1844 (25, 35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 511* (EPICS-GC/FID, measured range 2.0-25°C, Dewulf et al. 1995)
 246, 627 (6.0, 25°C, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
 $\ln K_{AW} = -3975/(T/K) + 0.00768 \cdot Z + 11.727$; with Z salinity 0-35.5‰, temp range: 2-35°C, (EPICS-GC/FID, Dewulf et al. 1995)
 526 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 466* (20°C, equilibrium air stripping-GC, measured range 10-50°C, Hovorka & Dohnal 1997)
 500 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{AW} = 4.416 - 1498/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

592* (EPICS-SPME, measured range 2–60°C, Görgényi et al. 2002)
 $\ln K_{AW} = 10.09 - 3447.7/(T/K)$; temp range 2–60°C (EPICS-SPME method, Görgényi et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 1.79 (shake flask-GC, Hansch et al. 1975, Hansch & Leo 1987)
- 1.92 (Hansch & Leo 1979)
- 1.79 (recommended, Sangster 1993)
- 1.89 (calculated-activity coefficients, Tse & Sandler 1994)
- 1.82* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
- 1.79 (recommended, Hansch et al. 1995)
- 1.75* (24.8°C, EPICS-GC, measured range 2.2–24.8°C, Dewulf et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 2.41 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 1.20 (estimated-S, Lyman et al. 1982)
- 1.28 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 1.60 (estimated-S, Lyman et al. 1982)
- 1.48 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
- 1.66 (soil, selected, Jury et al. 1990)
- 1.43, 1.46, 1.43, 1.48, 1.50, 1.49, 1.55 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, Belgium, organic carbon $f_{OC} = 4.12\%$, EPICS-GC/FID, Dewulf et al. 1999)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental $t_{1/2} = 22$ min for initial concentration of 1.0 mg/L when stirred at 200 rpm in water at approx. 25°C in an open container of depth 65 mm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982);
 Evaporation $t_{1/2}(\text{exptl}) = 32.2$ min, $t_{1/2}(\text{calc}) = 0.98$ min, 21.2 min from water (Dilling 1977);
 $t_{1/2} = 6\text{--}9$ d in a typical pond, $t_{1/2} = 5\text{--}8$ d in a typical lake, and $t_{1/2} = 24\text{--}32$ h in a typical river (Smith et al. 1980; quoted, Howard 1990);
 ratio of rate of evaporation to that of oxygen reaeration: measured value of 0.57 compared to that predicted value of 0.47 (Smith et al. 1980);
 $t_{1/2} = 45$ d for the volatilization loss from soil (Jury et al. 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (2.6 \pm 0.6) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow-laser magnetic resonance, Howard & Evenson 1976b; quoted, Callahan et al. 1979; Altshuller 1980; Howard 1990)

$k_{OH} = 2.6 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 44 d, loss of 2.3% in one day or 12 sunlit hour at 300 K in urban environments (Singh et al. 1981)

$k_{OH} < 1.6 \times 10^{11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ for the reaction with OH radical at 300 K (Lyman 1982)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $1.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical both at 25°C (Mabey et al. 1982; quoted, Ma et al. 1990)

photooxidation $t_{1/2} = 247\text{--}2468$ h, based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)

Hydrolysis: $k = 1.15 \times 10^{-7} \text{ M}^{-1} \text{ h}^{-1}$ for neutral process by analogy to dichloromethane (Mabey et al. 1982);

$k = 1.29 \times 10^{-6} \text{ h}^{-1}$ at pH 7 and 25°C with calculated $t_{1/2} = 61$ yr (Jeffers et al. 1989; quoted, Ellington 1989).

Biodegradation: $t_{1/2}(\text{aq. aerobic}) = 768\text{--}3696$ h, based on estimated methane acclimated soil grab sample data (Henson et al. 1989; quoted, Howard et al. 1991) and sub-soil grab sample data from a ground water aquifer

(Wilson et al. 1983; quoted, Howard et al. 1991); $t_{1/2}(\text{aq. anaerobic}) = 3072\text{--}14784$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$t_{1/2} > 60$ d (Olsen & Davis 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

calculated lifetime of 1.5 months based on reaction with OH radical (Callahan et al. 1979; Altshuller 1980; Howard 1990);

residence time of 44 d, loss of 2.3% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 247\text{--}2468$ h, based on photooxidation half-life in air (Atkinson 1985; quoted, Howard et al. 1991); estimated tropospheric lifetime of 0.02 yr (Nimitz & Skaggs 1992).

Surface water: $t_{1/2} = 768\text{--}3696$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Groundwater: $t_{1/2} = 1344\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life and sub-soil grab sample data from a groundwater aquifer (Wilson et al. 1983; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 10\text{--}50$ d (Ryan et al. 1988);

$t_{1/2} = 768\text{--}3696$ h, based on methane acclimated soil grab sample data (Henson et al. 1989; quoted, Howard et al. 1991) and sub-soil grab sample data from a groundwater aquifer (Wilson et al. 1983; quoted, Howard et al. 1991);

$t_{1/2} = 45$ d, volatilization loss from soil (Jury et al. 1990).

Biota: $t_{1/2} < 2$ d of elimination from whole body of bluegill sunfish (USEPA 1980; quoted, Howard 1990);

$t_{1/2} = 10\text{--}50$ d, subject to plant uptake via volatilization (Ryan et al. 1988).

TABLE 5.1.1.6.1

Reported aqueous solubilities of 1,1-dichloroethane at various temperatures

$$S/(\text{wt}\%) = 0.5826 - 7.8236 \times 10^{-3} \cdot (t/^{\circ}\text{C}) + 1.5268 \times 10^{-4} \cdot (t/^{\circ}\text{C})^2 - 3.6609 \times 10^{-7} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 9.4136 - 5.7249 \times 10^{-2} \cdot (T/\text{K}) + 9.17839 \times 10^{-5} \cdot (T/\text{K})^2 \quad (2)$$

5.1.1.7 1,2-Dichloroethane

Common Name: 1,2-Dichloroethane

Synonym: ethylene chloride, ethylene dichloride, glycol dichloride, sym-dichloroethane, Dutch oil, EDC

Chemical Name: 1,2-dichloroethane

CAS Registry No: 107-06-2

Molecular Formula: $C_2H_4Cl_2$, CH_2ClCH_2Cl

Molecular Weight: 98.959

Melting Point ($^{\circ}C$):

−35.7 (Lide 2003)

Boiling Point ($^{\circ}C$):

85.3 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.2531, 1.2458 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959; Dean 1985)

1.25209, 1.24637 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

78.0 (calculated-density, Wang et al. 1992)

93.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

35.15, 32.02 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

1.982 (calculated, Dreisbach 1959)

2.112 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0 (Suntio et al. 1988)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

8690* ($20^{\circ}C$, volumetric method, measured range $0-30^{\circ}C$, Rex 1906)

8650 (shake flask-interferometer, Gross 1929)

8720, 9000 ($15^{\circ}C$, $30^{\circ}C$, shake flask-interferometer, Gross & Saylor 1931)

8696 (volumetric method, Wright & Schaffer 1932)

8490* ($20^{\circ}C$, shake flask, measured range $0-56^{\circ}C$, Van Arkel & Vles 1936)

8620 (Seidell 1940)

8400 (data presented in graph, temp range $0-70^{\circ}C$, McGovern 1943; Horvath 1982)

8610* (shake flask-GC, temp range $0-80^{\circ}C$, Walraevens et al. 1974)

$\log [S/(mol/L)] = 2070/(T/K) - 15.369 + 0.0247 \cdot (T/K)$; temp range $0-80^{\circ}C$ (Walraevens et al. 1974)

8800 (shake flask-GC, McConnell et al. 1975)

8800 ($20^{\circ}C$, Pearson & McConnell 1975)

8570, 8390, 10250 (3, 20, $34^{\circ}C$, shake flask-GC/ECD, Chiou & Freed 1977)

8450 (shake flask-GC, Chiou et al. 1979)

8630 ($20^{\circ}C$, recommended, Sørensen & Arit 1979)

7987 (shake flask-LSC, Banerjee et al. 1980)

10600 (shake flask-titration, Coca & Diza 1980)

11000 (shake flask-titration/turbidity, Coca et al. 1980)

8000 (shake flask-LSC, Veith et al. 1980)

8608* (summary of literature data, temp range $0-80^{\circ}C$, Horvath 1982)

3506 ($30^{\circ}C$, shake flask-headspace-GC, McNally & Grob 1984)

8044 (calculated-UNIFAC activity coeff., Banerjee 1985)

8100 (Dean 1985, Riddick et al. 1986)

8782, 9102, 9960 (20, 35, $50^{\circ}C$, infinite dilution activity coeff. γ^{∞} -GC, Barr & Newsham 1987)

7200* ($19.7^{\circ}C$, shake flask-GC/TC, measured range $0-80^{\circ}C$, Stephenson 1992)

8500, 9013, 9163 (20, 30, $40^{\circ}C$, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

7809, 8727, 9209 (20, 30, 40°C, infinite dilution activity coeff. γ^∞ -UNIFAC, Tse et al. 1992)
 9400, 9209, 9835 (20, 35, 50°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 6537 (20°C, activity coeff. γ^∞ by inert air stripping-GC, Hovorka & Dohnal 1997)
 8600* (recommended, temp range 0–100°C, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)
 $S/(\text{wt}\%) = 17.9147 - 0.11684 \cdot (T/K) + 2.0003 \times 10^{-4} \cdot (T/K)^2$, temp range 273–373 K (eq. derived from literature solubility data, Horvath & Getzen 1999a)404

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

8130, 12980 (20°C, 30°C, Rex 1906)
 10519* (isotenoscope method, measured range –30.82 to 99.4°C, Pearce & Peters 1929)
 $\log (P/\text{mmHg}) = 128.756 - 4481.12/(T/K) - 52.3092 \cdot \log (T/K) + 0.07153 \cdot (T/K) - 4.1847 \times 10^{-5} \cdot (T/K)^2$; temp range 243–363 K (isotenoscope method, Pearce & Peters 1929)
 10660 (McGovern 1943)
 10740* (interpolated-Antoine eq., regression, temp range –30.8 to 99.4°C, Stull 1947)
 10700 (calculated-Antoine eq., Dreisbach 1959)
 $\log (P/\text{mmHg}) = 7.18431 - 1358.5/(252.0 + t/^\circ\text{C})$; temp range 6–161°C (Antoine eq. for liquid state, Dreisbach 1959)
 10150 (calculated-Antoine eq., Weast 1972–73)
 $\log (P/\text{mmHg}) = [-0.2185 \times 7950.7/(T/K)] + 7.708405$; temp range –44.5 to 285°C (Antoine eq., Weast 1972–73)
 10500 (calculated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 7.0253 - 1271.254/(222.927 + t/^\circ\text{C})$; temp range –30.82 to 99.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 8520 (McConnell et al. 1975)
 8400 (Pearson & McConnell 1975)
 13282*, 65145 (30, 70°C, vapor-liquid equilibrium VLE data, measured range 28.75–85.54°C, Gutsche & Knapp 1982)
 $\ln (P/\text{kPa}) = 14.142372 - 2896.480/[(T/K) - 52.506]$; temp range 301.9–357.69 K (vapor-liquid equilibrium VLE data, Gutsche & Knapp 1982)
 10500 (Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.16284 - 1278.323/(223.694 + t/^\circ\text{C})$; temp range –30.82 to 99.4°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.13975 - 1256.68/(220.504 + t/^\circ\text{C})$; temp range 28.75–84.54°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 7.0253 - 1271.3/(222.9 + t/^\circ\text{C})$; temp range –31 to 99°C (Antoine eq., Dean 1985, 1992)
 11110 (selected, Riddick et al. 1986)
 11100 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.07712 - 1247.8/(-50.15 + T/K)$; temp range 279–434 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.53278 - 1599.07/(-3.303 + T/K)$; temp range 356–558 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.07287 - 1245.488/(-50.392 + T/K)$; temp range 279–374 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.40918 - 1505.414/(-14.406 + T/K)$; temp range 368–524 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.5198 - 2129.577/(T/K)$; temp range 523–561 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 10462 (resistance measurements-Antoine eq., Foco et al. 1992)
 8270, 13320, 16720 (20, 30, 35°C, quoted from DIPPR, Tse et al. 1992)
 $\log (P/\text{mmHg}) = 48.4226 - 3.1803 \times 10^3/(T/K) - 15.37 \cdot \log (T/K) + 7.2935 \times 10^{-3} \cdot (T/K) + 2.6844 \times 10^{-14} \cdot (T/K)^2$; temp range 237–561 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.1 (exptl., $1/K_{AW} (C_W/C_A)$, Hine & Mookerjee 1975)
 92.3 (calculated- C_W/C_A , McConnell et al. 1975; Pearson & McConnell 1975)

- 99.0, 123.9 (exptl., calculated-P/C, Dilling 1977)
 111.3 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)
 174* (27.0°C, equilibrium cell-concn ratio-GC/FID, measured range 1.0–27.0°C, Leighton & Calo 1981)
 $\ln(k_H/\text{atm}) = 18.51 - 3482/(T/K)$; temp range: 1.0–23.0°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 110 (recommended, Mackay & Shiu 1981)
 111.5 (gas stripping-GC, Warner et al. 1987)
 143* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln[H/(\text{atm}\cdot\text{m}^3/\text{mol})] = -1.371 - 1522/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 92.0 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 70.8 (computed value, Yaws et al. 1991)
 101, 152, 182 (20, 30, 40°C, infinite dilution activity coeff. γ° -GC, Tse et al. 1992)
 110, 185, 319 (20, 35, 50°C, activity coeff. γ° -differential pressure transducer, Wright et al. 1992)
 122.5 (γ° from gas stripping-GC, Li et al. 1993)
 5.30, 8.99 (35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 102.1* (EPICS-GC/FID, measured range 2.0–25°C, Dewulf et al. 1995)
 55.9, 123 (6.0, 25°C, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
 $\ln K_{AW} = -4329/(T/K) + 0.00473\cdot Z + 11.377$; with Z salinity 0–35.5‰, temp range: 2–35°C, (EPICS-GC/FID, Dewulf et al. 1995)
 110 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 95.8 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1998)
 185.2 (EPICS-GC, Ayuttaya et al. 2001)
 102 (20°C, selected from reported experimentally determined values, Staudinger & Roberts 2001)
 $\log K_{AW} = 4.434 - 1705/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 1.48 (shake flask-GC, Leo et al. 1975; Hansch & Leo 1979, 1987)
 1.45 (shake flask-LSC, Banerjee et al. 1980; Veith et al. 1980)
 1.58, 1.54 (calculated-octanol and water mutual solubility not considered, calculated-octanol and water mutual solubility considered, Arbuckle 1983)
 1.44 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)
 1.48 (recommended, Sangster 1993)
 1.55 (calculated-from activity coefficients, Tse & Sandler 1994)
 1.51* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
 1.48 (recommended, Hansch et al. 1995)
 1.46* (24.8°C, EPICS-GC, measured range 2.2–24.8°C, Dewulf et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 2.78 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 0.30 (bluegill sunfish, Barrows et al. 1980)
 0.301 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1982)
 0.954 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982; quoted, Ma et al. 1990)
 0.30 (bluegill sunfish, Davies & Dobbs; quoted, Sabljic 1987; Ma et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 1.28 (soil, equilibrium sorption isotherm, Chiou et al. 1979)
 1.51 (soil, quoted from Chiou et al. 1979, Karickhoff 1981)
 1.06, 1.19, 1.48 (estimated- K_{OW} , estimated-S and mp, estimated-S, Karickhoff 1981)
 2.18 (estimated- K_{OW} , Lyman et al. 1982;)
 1.15 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 1.09 (BUA 1987; quoted, Brüggemann et al. 1991)

1.34 (soil, selected, Jury et al. 1990)

1.64, 1.645, 1.64, 1.68, 1.70, 1.65, 1.68 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, Belgium, organic carbon $f_{OC} = 4.12\%$, EPICS-GC/FID, Dewulf et al. 1999)

Sorption Partition Coefficient, $\log K_{OM}$:

1.28, 1.50 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental half-life of volatilization from aqueous solution of 1 mg/L to be (28 ± 1) min when stirred at 200 rpm in water at approx. 25°C in an open container (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982);

Evaporation $t_{1/2}(\text{exptl}) = 28.0$ min, $t_{1/2}(\text{calc}) = 4.5$ min, 24.5 min from water (Dilling 1977)

rate of evaporation $k = 2.4 \text{ g m}^{-2} \text{ s}^{-1}$ (Environment Canada 1984);

$t_{1/2} = 90$ d, estimated volatilization loss from soil (Jury et al. 1990).

Photolysis: photocatalyzed mineralization by the presence of TiO_2 with the rate of 1.1 ppm/min per gram of catalyst (Ollis 1985)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (2.2 \pm 0.5) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow-laser magnetic resonance, Howard & Everson 1976b; quoted, Callahan et al. 1979)

$k_{OH} = 0.1 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ and $t_{1/2} = 234$ h (Radding et al. 1977; quoted, Callahan et al. 1979)

$k_{OH} = 2.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with residence time of 53 d, loss of 1.9% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{OH} = 1.3 \times 10^{11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, estimated, at 300 K (Lyman 1982)

$k < 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k < 1 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radicals at 25°C (Mabey et al. 1982)

photooxidation $t_{1/2} = 292\text{--}2917$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k(\text{aq.}) \leq 0.05 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 21°C, with a $t_{1/2} \geq 8$ d at pH 7 (Yao & Haag 1991).

Hydrolysis:

$k = 5 \times 10^{-13} \text{ s}^{-1}$ with a max. $t_{1/2} = 50,000$ yr at pH 7 and 25°C from experimental data at 100–150°C (Radding et al. 1977; quoted, Callahan et al. 1979);

$k = 1.80 \times 10^{-9} \text{ h}^{-1}$ for neutral process (Mabey et al. 1982; quoted, Ma et al. 1990)

$t_{1/2}(\text{abiotic})$ or $t_{1/2}(\text{dehydrohalogenation}) = 50$ months (Mabey et al. 1983; quoted, Olsen & Davis 1990)

$k(\text{neutral}) = .63 \text{ yr}^{-1}$ with first-order $t_{1/2} = 1.1$ yr (Kollig et al. 1987; quoted, Howard et al. 1991)

$k = 1.1 \times 10^{-6} \text{ h}^{-1}$ at pH 7 and 25°C with calculated $t_{1/2} = 72$ yr (Jeffers et al. 1989; quoted, Ellington 1989; Brüggemann et al. 1991)

$t_{1/2} = 400$ d at pH 7 in natural waters (Capel & Larson 1995)

Biodegradation: relatively undegradable (Lyman et al. 1982; quoted, Brüggemann et al. 1991)

$k < 1.4 \times 10^{-5} \text{ min}^{-1}$ disappearance rate in sediment-water sample, with $t_{1/2} > 35$ d (Jafvert & Wolfe 1987)

$t_{1/2}(\text{aq. aerobic}) = 2400\text{--}4320$ h, based on unacclimated grab sample of aerobic soil from ground water aquifers and acclimated river die-away rate data (Wilson et al. 1983; Mudder 1981; quoted, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 9600\text{--}17280$ h (Howard et al. 1991)

$t_{1/2} > 60$ d (Olsen & Davis 1990)

$t_{1/2}(\text{aerobic}) = 100$ d, $t_{1/2}(\text{anaerobic}) = 400$ d in natural waters (Capel & Larson 1995)

Biotransformation: estimated to be $1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 17$ wk when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

lifetime of 1.7 months at 296 K based on reaction with OH radical (Callahan et al. 1979);

residence time of 53 d, loss of 1.9% in one day or 12 sunlit hour at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 292\text{--}2917$ h, based on photooxidation half-life in air from measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);

estimated tropospheric lifetime of 0.09 yr (Nimitz & Skaggs 1992).

Surface water: $t_{1/2} = 2400\text{--}4320$ h, based on unacclimated grab sample of aerobic soil from ground water aquifers and acclimated river die-away rate data (Wilson et al. 1983; Mudder 1981; quoted, Howard et al. 1991);

$t_{1/2} > 35$ d in sediment-water sample (Jafvert & Wolfe 1987)

$t_{1/2}(\text{aerobic}) = 100$ d, $t_{1/2}(\text{anaerobic}) = 400$ d in natural waters (Capel & Larson 1995)

measured rate constant $k \leq 0.05 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 21°C, with $t_{1/2} \geq 8$ d at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 2400\text{--}8640$ h, based on unacclimated grab sample of aerobic soil from ground water aquifers and estimated aqueous aerobic biodegradation half-life (Wilson et al. 1983; Howard et al. 1991).

Sediment: $t_{1/2} > 35$ d in Bar-H sediment-water sample (Jafvert & Wolfe 1987)

Soil: $t_{1/2} = 10\text{--}50$ d (Ryan et al. 1988);

$t_{1/2} = 90$ d, estimated volatilization loss from soil (Jury et al. 1990);

$t_{1/2} = 2400\text{--}4320$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $1 < t_{1/2} < 2$ d in tissues of bluegill sunfish (Barrows et al. 1980);

$t_{1/2} = 10\text{--}50$ d, subject to plant uptake via volatilization (Ryan et al. 1988).

TABLE 5.1.1.7.1

Reported aqueous solubilities of 1,2-dichloroethane at various temperatures

$$\log [S/(\text{mol/L})] = -A + 2070/(T/K) + B(T/K) \quad (1)$$

$$S/(\text{wt}\%) = 0.888 - 4.0468 \times 10^{-3} \cdot (t/^{\circ}\text{C}) + 9.37388 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 + 9.8465 \times 10^{-7} \cdot (t/^{\circ}\text{C})^3 \quad (2)$$

$$S/(\text{wt}\%) = 17.9147 - 0.11684 \cdot (T/K) + 2.0003 \times 10^{-4} \cdot (T/K)^2 \quad (3)$$

 (−5.2 to 5.5)

FIGURE 5.1.1.7.4 Logarithm of K_{OW} versus reciprocal temperature for 1,2-dichloroethane.

5.1.1.8 1,1,1-Trichloroethane

Common Name: 1,1,1-Trichloroethane

Synonym: methyl chloroform, chlorotene, Genklene, Baltana

Chemical Name: 1,1,1-trichloroethane

CAS Registry No: 71-55-6

Molecular Formula: CH_3CCl_3

Molecular Weight: 133.404

Melting Point ($^{\circ}\text{C}$):

−30.01 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

74.09 (Lide 2003)

Density (g/cm^3 at 20°C):

1.3390 (Dreisbach 1961; Horvath 1982; Weast 1982–83; McNally & Grob 1984)

1.3381, 1.3299 (20°C , 25°C , Riddick et al. 1986)

Molar Volume (cm^3/mol):

99.0, 52.0 (calculated-density, intrinsic volume-van der Waals method, Abernethy et al. 1988)

100.0 (calculated-density, Wang et al. 1992)

114.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

32.74, 29.74 (25°C , bp, Dreisbach 1961)

32.39, 29.708 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

2.35 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0 (Suntio et al. 1988)

Water Solubility (g/m^3 or mg/L at 25°C or as indicated or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section):

1320* (20°C , shake flask, measured range 0 – 50°C , Van Arkel & Vles 1936)

1304 (Seidell 1940)

1490* (shake flask-GC, measured range 10 – 80°C , Walraevens et al. 1974)

$\log [S/(\text{mol}/\text{L})] = 2070/(T/\text{K}) - 14.860 + 0.020 \cdot (T/\text{K})$; temp range 2630353 K (shake flask, Walraevens et al. 1974)

480 (20°C , shake flask-GC, Pearson & McConnell 1975; McConnell et al. 1975)

880, 720 (1.5, 25°C , average literature values, Dilling 1977)

1360 (shake flask, Chiou et al. 1979)

1320 (20°C , recommended, Sørensen & Arit 1979)

100 (shake flask-titration, Coca & Diaz 1980)

1334 (shake flask-LSC, Banerjee et al. 1980)

1150, 1200 (23.5°C , elution chromatography, Schwarz 1980)

1850* (20°C , elution chromatography, measured range 10 – 30°C , Schwarz & Miller 1980)

1334; 278.7 (shake flask-LSC; calculated-f const., Veith et al. 1980)

1260 (calculated-group contribution as per Irmann 1965, Horvath 1982)

1485* (summary of literature data, temp range 0 – 80°C , Horvath 1982)

3200 (calculated-UNIFAC activity coeff., Arbuckle 1983)

479.8 (30°C , headspace-GC, McNally & Grob 1984)

1334 (calculated-UNIFAC activity coeff., Banerjee 1985)

1320 (20°C , selected, Riddick et al. 1986)

1310, 1194, 1267 (20 , 35 , 50°C , infinite dilution activity coeff. γ^{∞} -GC, Barr & Newsham 1987)

1252 (23 – 24°C , shake flask-GC, Broholm et al. 1992)

700* (20.2°C , shake flask-GC/TC, measured range 0 – 71.5°C , Stephenson 1992)

1260, 1353, 1370 (20, 30, 40°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 1413, 1392, 1454, 1489 (20, 30, 35, 40°C, infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)
 2935, 3228, 3536, 3749 (20, 30, 35, 40°C, infinite dilution activity coeff. γ^∞ -UNIFAC, Tse et al. 1992)
 1758 (γ^∞ from gas stripping-GC, Li et al. 1993)
 1250 (shake flask-GC, Broholm & Feenstra 1995)
 1380 (20°C, activity coeff. γ^∞ by inert air stripping-GC, Hovorka & Dohnal 1997)
 1290* (recommended, temp range 0–50°C, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)
 $S/(\text{wt}\%) = 1.09092 - 6.52776 \times 10^{-3} \cdot (T/K) + 1.10747 \times 10^{-5} \cdot (T/K)^2$, temp range 273–323 K (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

12159* (17.68°C, static method-Hg manometer, measured range 268–290 K, Rubin et al. 1944)
 $\log(P/\text{cmHg}) = 6.92013 - 1729/(T/K)$; temp range 268–290 K (Hg manometer, Rubin et al. 1944)
 16190* (interpolated from Antoine eq. regression, temp range –52 to 74.1°C, Stull 1947)
 16100 (calculated-Antoine eq., Dreisbach 1961)
 $\log(P/\text{mmHg}) = 6.94983 - 1217.0/(225.0 + t/^\circ\text{C})$; temp range –3 to 111°C (Antoine eq. for liquid state, Dreisbach 1961)
 16170 (calculated-Antoine eq., Weast 1972–73)
 $\log(P/\text{mmHg}) = [-0.2185 \times 8012.7/(T/K)] + 7.955902$; temp range –52 to 74.1°C (Antoine eq., Weast 1972–73)
 16490* (ebulliometry, measured range –77.15 to 25°C, Ambrose et al. 1975)
 16490 (ebulliometry, measured –77.15 to 25°C, Boublik et al. 1984)
 17800 (calculated-Antoine eq., Boublik et al. 1973, 1984)
 $\log(P/\text{mmHg}) = 8.64344 - 2136.621/(302.769 + t/^\circ\text{C})$; temp range –5.36 to 16.92°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 12800 (20°C, Pearson & McConnell 1975; McConnell et al. 1975)
 17800, 16490 (calculated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 7.78612 - 2147.034/(303.568 + t/^\circ\text{C})$; temp range –5.36 to 16.92°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.13297 - 1260.034/(231.327 + t/^\circ\text{C})$; temp range –77.2 to 25°C (Antoine eq. from reported exptl. data of Ambrose et al. 1973, Boublik et al. 1984)
 $\log(P/\text{mmHg}) = 8.6434 - 2136.6/(302.8 + t/^\circ\text{C})$; temp range –6 to 17°C (Antoine eq., Dean 1985, 1992)
 16490 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 5.98755 - 1182.527/(222.594 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 16490 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 5.98755 - 1182.527/(-50.256 + T/K)$; temp range; 295–372 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.00452 - 1193.604/(-48.734 + T/K)$; temp range 349–408 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.36873 - 1474.394/(-8.08 + T/K)$; temp range 399–487 K (Antoine eq.-III, Stephenson & Malanowski 1987)
 16530, 960 (quoted, calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)
 13150, 20520, 25300, 30940 (20, 30, 35, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log(P/\text{mmHg}) = 36.5468 - 2.821 \times 10^3/(T/K) - 10.205 \cdot \log(T/K) - 2.6369 \times 10^{-9} \cdot (T/K) + 3.7075 \times 10^{-6} \cdot (T/K)^2$; temp range 243–545 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1638 (calculated as $1/K_{\text{AW}}, C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)
 3433 (20°C, McConnell et al. 1975)
 2800, 2875 (exptl., calculated-P/C, Dilling 1977)
 2025 (20°C, batch stripping-GC, Mackay et al. 1979)
 730 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)
 $\log(k_{\text{H}}/\text{atm}) = 9.39 - 1992.95/(T/K)$, (least-square regression of data from lit., Kavanaugh & Trussell 1980)
 1996* (equilibrium cell-concn ratio-GC/FID, measured range 1–26.1°C, Leighton & Calo 1981)

- $\ln (k_H/\text{atm}) = 21.68 - 4375/(T/K)$; temp range 1.9–24.9°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 1520 (20°C, batch air stripping, Munz & Roberts 1982)
 836, 1317, 2155 (10, 20, 30°C, multiple equilibrium-GC, Munz 1985)
 606.9 (20°C, predicted-UNIFAC activity coeff., Arbuckle 1983)
 1319* (multiple equilibrium technique-GC, temp range 5–33°C, Hunter-Smith et al. 1983)
 $\ln K_{AW} = 9.15 - 2915/(T/K)$; measured range 5–33°C (distilled water, multiply equilibrium-GC, Hunter-Smith 1983)
 $\ln K_{AW} = 13.04 - 3905/(T/K)$; measured range 5–33°C (seawater, multiply equilibrium-GC, Hunter-Smith 1983)
 1743 (20°C, EPICS-GC, Lincoff & Gossett 1983; Gossett 1985)
 1337, 1358 (20°C, EPICS-GC/FID, batch air stripping-GC, Lincoff & Gossett 1984)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 10.21 - 4262/(T/K)$; temp range 10–30°C (EPICS measurements, Lincoff & Gossett 1984)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 9.975 - 4186/(T/K)$; temp range 10–30°C (batch air stripping measurements, Lincoff & Gossett 1984)
 498.5 (adsorption isotherm, Urano & Murata 1985)
 1360 (20°C, multiple equilibration, Munz & Roberts 1986; quoted, Yurteri et al. 1987)
 $\log K_{AW} = 5.327 - 1636/(T/K)$; temp range 10–30°C (EPICS-GC measurements, Munz & Roberts 1987)
 498.5 (gas stripping-GC, Warner et al. 1987)
 1345, 1413* (20, 25°C, EPICS-GC/FID, measured range 9.6–24.6°C, Gossett 1987)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 9.777 - 4133/(T/K)$; temp range 9.6–34.6°C (EPICS measurements, Gossett 1987)
 1572 (20°C, EPICS, Yurteri et al. 1987)
 1763* (EPICS-GC, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 7.351 - 3399/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 1317 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 1578* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)
 $\ln (1/K_{AW}) = -2.52 + 950/(T/K)$; temp range 40–80°C (equilibrium headspace-GC measurements, Kolb et al. 1992)
 1277, 2027, 2381, 2847 (20, 30, 35, 40°C, from measured activity coeff. γ^∞ -GC, Tse et al. 1992)
 1380, 1998, 2952 (20, 30, 40°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 1763* (26.3°C, EPICS-GC, measured range 26.3–44.8°C, Hansen et al. 1993)
 $\ln [H/(\text{kPa} \cdot \text{m}^3/\text{mol})] = -3120/(T/K) + 11.0$; temp range 26.3–45°C (EPICS-GC, Hansen et al. 1993)
 1783* (static headspace-GC, measured range 25–50°C, Robbins et al. 1993)
 1507* (EPICS-GC/FID, measured range 2.0–25°C, Dewulf et al. 1995)
 800, 2010 (6.0, 25°C, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
 $\ln K_{AW} = -3834/(T/K) + 0.00897 \cdot Z + 12.351$; with Z salinity 0–35.5‰, temp range 2–35°C, (EPICS-GC/FID measurements, Dewulf et al. 1995)
 1387 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 2072 (vapor-liquid equilibrium-GC, Turner et al. 1996)
 $K_{AW} = 0.204 + 0.0182 \cdot (T/K) + 0.000173 \cdot (T/K)^2$; temp range 0–35°C (vapor-liquid equilibrium-GC with additional lit. data, Turner et al. 1996)
 1280 (20°C, inert air stripping-GC, Hovorka & Dohnal 1997)
 1614, 1750, 1415; 1380 (direct calculated method, gas-phase EPICS method, liquid-phase EPICS method; quoted lit. Chiang et al. 1998)
 1370 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{AW} = 5.163 - 1588/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 2.17 (Tute 1971)
 2.49 (shake flask, Hansch & Leo 1979; Hansch & Leo 1985)
 2.47 (shake flask-LSC, Banerjee et al. 1980)
 2.47 (shake flask-LSC, Veith et al. 1980; Veith & Kosian 1982)
 2.35, 2.29 (calculated-UNIFAC with octanol and water mutual solubility not considered, calculated-UNIFAC with octanol and water mutual solubility considered, Arbuckle 1983)
 1.96 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)
 2.49 (recommended, Sangster 1993)
 2.60 (calculated-activity coefficients, Tse & Sandler 1994)

- 2.47* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
 2.20* (24.8°C, EPICS-GC, measured range 2.2–24.8°C, Dewulf et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 2.70 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 1.40 (calculated- K_{OW} , Veith et al. 1979; Veith et al. 1980)
 0.954 (bluegill sunfish, Veith et al. 1980)
 0.954 (bluegill sunfish, Barrows et al. 1980)
 1.908 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 0.950 (bluegill sunfish, Veith & Kosian 1982)
 1.70 (calculated-MCI χ , Koch 1983)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 2.02 (soil, equilibrium sorption isotherm, Chiou et al. 1979)
 2.25 (quoted from Chiou et al. 1979, Karickhoff 1981, 1985)
 2.08, 2.04, 2.02 (estimated- K_{OW} , estimated-S and mp, estimated-S, Karickhoff 1981)
 2.182 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 2.20 (soil, best estimate, Karickhoff 1985)
 1.70 (calculated-MCI χ , Bahnick & Doucette 1988)
 2.26 (20°C, soil, Chiou et al. 1988)
 1.65 (20°C, soil, sand and loess, sorption isotherm-headspace method, Grathwohl 1990)
 2.22 (20°C, weathered shale and mudrock, sorption isotherm-headspace method, Grathwohl 1990)
 3.02 (20°C, unweathered shale and mudrock, sorption isotherm-headspace method, Grathwohl 1990)
 2.053 (soil, selected, Jury et al. 1990)
 1.95, 1.98, 1.99, 2.01, 1.98, 2.03 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, Belgium, organic carbon $f_{OC} = 4.12\%$, EPICS-GC/FID, Dewulf et al. 1999)
 3.20 (soil, calculated-universal solvation model, Winget et al. 2000)
 2.16 (soil: organic carbon $OC \geq 0.1\%$, average, Delle Site 2001)

Sorption Partition Coefficient, $\log K_{OM}$:

- 2.02, 1.55 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization: evaporation $t_{1/2}(\text{exptl}) = 21$ min, $t_{1/2}(\text{calc}) = 0.34$ min from water (Dilling et al. 1975)
 $t_{1/2}(\text{exptl}) \sim (20 \pm 3)$ min at 25°C for an aqueous solution of 1 mg L⁻¹ when stirred at 200 rpm in an open container of depth 65 mm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982);
 Evaporation $t_{1/2}(\text{exptl}) = (17.3\text{--}24.9)$ min, $t_{1/2}(\text{calc}) = 0.19$ min, 23.7 min at 20–25°C, and $t_{1/2} = 30.2$ min at 15°C from water (Dilling 1977);
 estimated $t_{1/2} \sim 3.7$ h from water (Thomas 1982);
 $k = 0.029$ d⁻¹, $t_{1/2} = 24$ d in spring at 8–16°C, $k = 0.058$ d⁻¹, $t_{1/2} = 12$ d in summer at 20–22°C, $k = 0.063$ d⁻¹, $t_{1/2} = 11$ d in winter at 3–7°C for the periods when volatilization appears to dominate, and $k = 0.60$ d⁻¹, $t_{1/2} = 11.5$ d with HgCl₂, and $k = 0.072$ d⁻¹, $t_{1/2} = 9.6$ d without HgCl₂ in September 9–15, in marine mesocosm experiments (Wakeham et al. 1983);
 estimated $t_{1/2} \sim 365$ d for volatilization loss from soil to be 365 d (Jury et al. 1990).

Photolysis: not expected to be important (Howard et al. 1991).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

- $k_{OH} = 3.36 \times 10^{-14}$ cm³ molecule⁻¹ s⁻¹ with a troposphere life time of 1.1 yr at 298 K (relative rate method, Cox et al. 1976; quoted, Callahan et al. 1979)
 $k_{OH} = (1.5 \pm 0.3) \times 10^{-14}$ cm³ molecule⁻¹ s⁻¹ at 296 K (discharge flow-resonance fluorescence, Howard & Evenson 1976b)

$k_{\text{OH}}^* = (2.19 \pm 0.26) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 275–405 K, with calculated lifetime of 3.8–6.0 yr in troposphere (discharge flow system-resonance fluorescence, Chang & Kaufman 1977)

$k_{\text{OH}} = (1.59 \pm 0.16) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K with lifetime of 13 yr (flash photolysis-resonance fluorescence, Watson et al. 1977; quoted, Callahan et al. 1979; Altshuller 1980)

$k_{\text{OH}}^* = (1.06 \pm 0.09) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 293 K, measured range 278–461 K (discharge flow-resonance fluorescence, Jeong & Kaufman 1979)

$k_{\text{OH}}^* = (1.08 \pm 0.20) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 222–363 K (flash photolysis resonance fluorescence, Kurylo et al. 1979)

$k_{\text{OH}} = 1.0 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, with an estimated toxic chemical residence time of 1160 d, loss < 0.1% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k = 9.0 \times 10^9 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, estimated at 300 K (Lyman 1982)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $1.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

photooxidation $t_{1/2} = 5393\text{--}53929 \text{ h}$, based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k_{\text{OH}}(\text{calc}) = 1.3 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.19 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1987)

$k_{\text{OH}}^* = 1.19 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}} = 1.19 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a troposphere lifetime of 1.7 yr for a global average concentration of OH radical (Prinn et al. 1987; quoted, Bunce et al. 1991)

$k_{\text{O}_3}(\text{aq.}) \leq 0.012 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} \geq 32 \text{ d}$ at pH 7 (Yao & Haag 1991).

Hydrolysis: $k = 0.12 \text{ month}^{-1}$ with $t_{1/2}(\text{exptl.}) = 6 \text{ months}$ at pH 7 and 25°C (Dilling et al. 1975; quoted, Callahan et al. 1979; Mabey et al. 1979; Neely 1985);

$k = 0.96 \text{ yr}^{-1}$ at pH 7 and 25°C with a first-order hydrolysis $t_{1/2} = 0.73 \text{ yr}$ (Kollig et al. 1987);

$k = (1.93 \pm 0.40) \times 10^{-8} \text{ s}^{-1}$ in distilled water contained 0.1% w/w CH_2O as sterilant with 39% conversion,

$k = (2.04 \pm 0.47) \times 10^{-8} \text{ s}^{-1}$ in autoclaved distilled water with 40% conversion and

$k = (1.80 \pm 0.90) \times 10^{-8} \text{ s}^{-1}$ in sediment contained 0.1% w/w CH_2O as sterilant with 25% conversion at 25°C, calculated $t_{1/2} = 350 \text{ d}$ at 25°C (Haag & Mill 1988)

$t_{1/2} = 6 \text{ months}$, abiotic hydrolysis or dehydrohalogenation half-life (Olsen & Davis 1990)

$t_{1/2} = 0.73 \text{ yr}$, based on reported rate constant at pH 7 at 25°C (Howard et al. 1991)

Biodegradation:

$k = 0.043 \text{ d}^{-1}$ in fresh water plus sediment incubated under anaerobic conditions (Wood et al. 1981; quoted, Klečka 1985);

$t_{1/2}(\text{aq. aerobic}) = 3360\text{--}6552 \text{ h}$, based on unacclimated aerobic seawater grab sample data and sub-soil sample data from a ground water aquifer (Pearson & McConnell 1975; Wilson et al. 1983; quoted, Howard et al. 1991);

$t_{1/2}(\text{aq. anaerobic}) = 13440\text{--}26208 \text{ h}$, based on estimated unacclimated aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 26 \text{ wk}$, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

estimated troposphere residence time of 1.1 yr for reaction with OH radical (CEQ 1975);

estimated N. troposphere residence time of 7.2 yr by one compartment non-steady state model (Singh et al. 1978);

estimated troposphere residence time of 8–10 yr by two compartment non-steady state model (Singh 1977; Singh et al. 1979);

lifetime of 8 yr in troposphere (Altshuller 1980);

estimated toxic chemical residence time of 1160 d, loss < 0.1% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

atmospheric lifetime $\tau = 6.3 \text{ yr}$ (Prinn et al. 1987);

troposphere lifetime of 1.7 yr for a global average concentration of OH radical (Bunce et al. 1991)

$t_{1/2} = 5393\text{--}53929$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

estimated tropospheric lifetime of 7.8 yr and 6.1 yr by rigorous calculations (Nimitz & Skaggs 1992).

Surface water: $t_{1/2} = 24$ d in the spring at $8\text{--}16^\circ\text{C}$, $t_{1/2} = 12$ d in the summer at $20\text{--}22^\circ\text{C}$, $t_{1/2} = 11$ d in the winter at $3\text{--}7^\circ\text{C}$ when volatilization dominates, and $t_{1/2} = 11.5$ d and 9.6 d for experiments with and without HgCl_2 as poison, respectively, in September 9–15 in marine mesocosm experiment (Wakeham et al. 1983);

calculated hydrolysis $t_{1/2} = 350$ d at 25°C (Haag & Mill 1988);

$t_{1/2} = 3360\text{--}6552$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$k(\text{exptl}) \leq 0.012 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C , with $t_{1/2} \geq 32$ d at pH 7 (Yao & Haag 1991).

Ground water: estimated $t_{1/2} \sim 1.0$ yr in the groundwater of the Netherlands (Zoeteman et al. 1981);

$t_{1/2} = 3360\text{--}13104$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life and sub-soil grab sample data from a ground water aquifer (Howard et al. 1991; Wilson et al. 1983).

Sediment: measured $t_{1/2} = 450$ d at 25°C , based on neutral and base-catalyzed hydrolysis rates studied in pure water and in barely saturated subsurface sediment at $25\text{--}60^\circ\text{C}$ (Haag & Mill 1988).

Soil: $t_{1/2} = 365$ d, estimated volatilization loss (Jury et al. 1990);

$t_{1/2} = 3360\text{--}6552$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980).

TABLE 5.1.1.8.1

Reported aqueous solubilities of 1,1,1-trichloroethane at various temperatures

$$S/(\text{wt}\%) = 0.1910 - 2.2811 \times 10^{-3} \cdot (t/^\circ\text{C}) + 2.5529 \times 10^{-5} \cdot (t/^\circ\text{C})^2 - 2.4775 \times 10^{-8} \cdot (t/^\circ\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 1.09092 - 6.52776 \times 10^{-3} \cdot (T/\text{K}) + 1.10747 \times 10^{-5} \cdot (T/\text{K})^2 \quad (2)$$

ΔH	-20.2		

FIGURE 5.1.1.8.4 Logarithm of K_{OW} versus reciprocal temperature for 1,1,1-trichloroethane.

5.1.1.9 1,1,2-Trichloroethane

Common Name: 1,1,2-Trichloroethane

Synonym: vinyl trichloride

Chemical Name: 1,1,2-trichloroethane

CAS Registry No: 79-00-5

Molecular Formula: $\text{CH}_2\text{ClCHCl}_2$

Molecular Weight: 133.404

Melting Point ($^{\circ}\text{C}$):

-36.3 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

113.8 (Lide 2003)

Density (g/cm^3 at 20°C):

1.440 (Dreisbach 1959; Weast 1982–83; Verschueren 1983;)

1.43931, 1.43213(20°C , 25°C , Riddick et al. 1986)Molar Volume (cm^3/mol):

93.0 (calculated-density, Wang et al. 1992)

114.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):46.77, 37.07 (25°C , bp, Dreisbach 1961)40.28, 34.23 (25°C , bp, Riddick et al. 1986)Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.543 (Dreisbach 1959; quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

3704 (volumetric method, Wright & Schaffer 1932)

4580* (shake flask, measured range 0 – 55°C , Van Arkel & Vles 1936)

4418 (Seidell 1940)

4400 (data presented in graph, temp range 0 – 70°C , McGovern 1943)

4400 (shake flask-refractive index and density, Treybal et al. 1946)

4380* (shake flask-GC, measured range 0 – 80°C , Walraevens et al. 1974) $\log [S/(\text{mol}/\text{L})] = 2070/(T/K) - 15.285 + 0.0230 \cdot (T/K)$; temp range 0 – 80°C (Walraevens et al. 1974)

4420 (literature average, Dilling 1977)

4500 (20°C , Verschueren 1977, 1983)4370 (20°C , recommended, Sørensen & Arit 1979)

5100 (shake flask-titration/turbidity, Coca & Diaz 1980, Coca et al. 1980)

1490 (shake flask-LSC, Veith et al. 1980)

4394* (summary of literature data, temp range 0 – 80°C , Horvath 1982)4365 (30°C , headspace-GC, McNally & Grob 1984)

4800 (Dean 1985)

4941, 4876, 5183 (20 , 35 , 50°C , infinite dilution activity coeff. γ^{∞} -GC, Barr & Newsham 1987)2858, 1469 (predicted-MCI χ and polarizability, Nirmalakhandan & Speece 1988)4580* (31.3°C , shake flask-GC/TC, measured range 0 – 90.8°C , Stephenson 1992)4813, 5035, 5205 (20 , 30 , 40°C , infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)2574, 2960, 3378 (20 , 30 , 40°C , infinite dilution activity coeff. γ^{∞} -UNIFAC, Tse et al. 1992)4877, 5257, 6075 (20 , 35 , 50°C , activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)4460 (20°C , activity coeff. γ^{∞} by inert air stripping-GC, Hovorka & Dohnal 1997)

4590* (tentative values, temp range 0–55°C, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(\text{wt}\%) = 2.89796 - 1.8585 \times 10^{-2} \cdot (T/K) + 3.48961 \times 10^{-5} \cdot (T/K)^2$, temp range 273–328 K (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated* are compiled at the end of this section):

26664* (73.5°C, ebulliometry, measured range 73.5–113.5°C, Treybal et al. 1946)

3090* (Antoine eq. regression, temp range –24 to 113.9°C, Stull 1947)

19114* (49.97°C, ebulliometry, measured range 49.97–113.67°C, Dreisbach & Shrader 1949)

2998 (calculated-Antoine eq., Dreisbach 1959)

$\log(P/\text{mmHg}) = 6.84165 - 1262.6/(205.0 + t/^\circ\text{C})$; temp range 30–186°C (Antoine eq. for liquid state, Dreisbach 1959)

3217 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/\text{mmHg}) = 6.96527 - 1351.0/(217.0 + t/^\circ\text{C})$; temp range 29–155°C (Antoine eq. for liquid state, Dreisbach 1961)

3088 (calculated-Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 9163.2/(T/K)] + 8.079996$; temp range –24 to 113.9°C, (Antoine eq., Weast 1972–73)

2910 (extrapolated-Antoine eq., Boublik et al. 1973, 1984)

$\log(P/\text{mmHg}) = 6.95185 - 1314.41/(209.197 + t/^\circ\text{C})$; temp range 49.97–113.7°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1973)

3066 (literature average, Dilling 1977)

2533, 4266 (20, 30°C, Verschuereen 1983)

$\log(P/\text{kPa}) = 6.13975 - 1313.598/(209.106 + t/^\circ\text{C})$; temp range 49.97–113.9°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)

$\log(P/\text{mmHg}) = 6.95185 - 1314.41/(209.20 + t/^\circ\text{C})$; temp range 50–114°C (Antoine eq., Dean 1985, 1992)

2998 (selected lit., Riddick et al. 1986)

$\log(P/\text{kPa}) = 6.10301 - 1332.6/(211.38 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

3218 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.09017 - 1351.0/(-56.15 + T/K)$; temp range 302–428 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.13875 - 1351.685/(-59.953 + T/K)$; temp range 316–384 K (Antoine eq., Stephenson & Malanowski 1987)

2369, 4012, 6590 (20, 30, 40°C, quoted from DIPPR, Tse et al. 1992)

$\log(P/\text{mmHg}) = 25.0845 - 2.7368 \times 10^3/(T/K) - 5.9182 \cdot \log(T/K) + 2.5155 \times 10^{-10} \cdot (T/K) + 1.1831 \times 10^{-6} \cdot (T/K)^2$; temp range 237–602 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

92.1 (calculated as $1/K_{\text{AW}} \cdot C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)

94.2 (calculated-P/C, Dilling 1977)

78.4 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)

122, 120 (calculated-P/C, recommended, Mackay & Shiu 1981, 1990)

81.4* (24.3°C, equilibrium cell-concn ratio-GC/FID, measured range 2.5–26.1°C, Leighton & Calo 1981)

$\ln(k_{\text{H}}/\text{atm}) = 16.20 - 3690/(T/K)$; temp range 2.5–26.1°C (equilibrium cell-concn ratio, Leighton & Calo 1981)

92.2* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)

$\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 9.320 - 4943/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)

74.97 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

97.34 (computed value, Yaws et al. 1991)

70.9, 115.5, 172.3 (20, 30, 40°C, infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)

67.1, 136, 234 (20, 35, 50°C, activity coeff γ^∞ -differential pressure transducer, Wright et al. 1992)

82* (26.2°C, EPICS-GC, measured range 26.2–44.8°C, Hansen et al. 1993)

$\ln[H/(\text{kPa} \cdot \text{m}^3/\text{mol})] = -5091/(T/K) + 17.0$; temp range 26.2–45°C (EPICS-GC measurements, Hansen et al. 1993)

- 1.30, 2.48 (35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 122 (quoted from Howard 1989–1991, Capel & Larson 1995)
 66.8 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1998)
 65.7 (20°C, exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)
 66.78 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 5.219 - 1989/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperature designated * are compiled at the end of this section:

- 2.17 (calculated as per Tute 1971, Callahan et al. 1979; Ryan et al. 1988)
 2.38 (Hansch & Leo 1979)
 1.89 (shake flask, Log P Database, Hansch & Leo 1987)
 1.89 (recommended, Sangster 1993)
 2.07 (calculated-activity coefficients, Tse & Sandler 1994)
 1.98* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)
 1.89 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 3.40 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- < 1.0 (Kawasaki 1980; quoted, Howard 1990)
 1.519 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 1.23 (quoted, Isnard & Lambert 1988)
 1.049 (calculated- K_{OW} , McCarty et al. 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 1.845 (sandy soil column, Wilson et al. 1981)
 1.748 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 3.20; 1.90 (soil, calculated-universal solvation model; quoted exptl., Winget et al. 2000)
 1.88 (soil: organic carbon OC $\geq 0.1\%$, average, Delle Site 2001)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 21$ min, estimated from lab. experiment of initial 1 mg/L in water stirred at 200 rpm at 25°C in an open container of depth 65 mm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982; Howard 1990)

Evaporation $t_{1/2}(\text{exptl}) = 35.1$ min, $t_{1/2}(\text{calc}) = 6.1$ min, 30.1 min from water (Dilling 1977)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:
 $k_{OH}^* = (3.18 \pm 0.06) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 278–461 K (discharge flow-resonance fluorescence, Jeong & Kaufman 1979)

$k_{OH} = 3.3 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, with estimated residence time of 35 d, loss of 2.8% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 3.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)
 photooxidation $t_{1/2} \sim 196$ –1956 h, based on measured rate constants for reaction with hydroxyl radical in air (estimated, Atkinson 1985; quoted, Howard et al. 1991)

$k_{OH}^* = (3.18 \pm 0.2) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 277–461 K (discharge flow-resonance fluorescence, Jeong et al. 1984)

$k_{O_3}(\text{aq.}) \leq 0.08 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} \geq 5$ d at pH 7 (Yao & Haag 1991).

$k_{OH}(\text{aq.}) = 1.1 \times 10^8 \text{ M}^{-1} \text{ h}^{-1}$ for the reaction with OH radical in aqueous solution (Haag & Yao 1992)

Hydrolysis:

$k = 1.2 \times 10^{-7} \text{ h}^{-1}$ at 25°C and pH 7 (estimated, Mabey et al. 1982)

$k = 5.9 \times 10^{-3} \text{ M}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 3263 \text{ h}$, based on alkaline catalyzed hydrolysis reaction at pH 9 and 25°C;
 $t_{1/2} = 37 \text{ yr}$, based on hydrolysis rate constant measured at pH 7 and 25°C (Mabey et al. 1983; quoted, Howard 1990; Howard et al. 1991)

$t_{1/2}(\text{abiotic})$ or $t_{1/2}(\text{dehydrohalogenation}) = 170 \text{ months}$ (Olsen & Davis 1990)

$t_{1/2} = 14000 \text{ d}$ at pH 7, $t_{1/2} = 0.14 \text{ d}$ at pH 12 in natural waters (Capel & Larson 1995)

Biodegradation:

$t_{1/2}(\text{aq. aerobic}) = 4320\text{--}8760 \text{ h}$, based on the extremely low or no biodegradation which was observed in screening tests and a river die-away test (Tabak et al. 1981; Kawasaki 1980; Mudder & Musterman 1982; quoted, Howard 1990; Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 17280\text{--}35040 \text{ h}$, based on estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991)

$k = 0.04 \text{ yr}^{-1}$ with $t_{1/2} = 24 \text{ d}$ (Wood et al. 1985; quoted, Olsen & Davis 1990)

$t_{1/2}(\text{aerobic}) = 180 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 720 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: estimated rate constant $k = 3 \times 10^{-12} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 0.763 \text{ h}^{-1}$ (flagfish, calculated-BCF $\times k_2$, McCarty et al. 1992)

$k_2 = 0.0676 \text{ h}^{-1}$ (flagfish, estimated from one compartment first-order kinetic, McCarty et al. 1992)

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the reaction with OH radical in air (Darnall et al. 1976);

photodecomposition $t_{1/2} = 15.9 \text{ h}$ with NO under simulated atmospheric conditions (Dilling et al. 1976);

estimated residence time of 35 d, loss of 2.8% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 196\text{--}1956 \text{ h}$, based on measured rate constants for reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991).

Surface water: estimated $t_{1/2} = 1.9 \text{ d}$ in surface waters in the Netherlands in case of a first order reduction process (Zoeteman et al. 1980)

$t_{1/2} = 3263\text{--}8760 \text{ h}$, based on estimated hydrolysis half-life at pH 9 and 25°C (Mabey et al. 1983; quoted, Howard et al. 1991) and estimated unacclimated aerobic aqueous degradation half-life (Howard et al. 1991)

Biodegradation $t_{1/2}(\text{aerobic}) = 100 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 400 \text{ d}$ and hydrolysis $t_{1/2} = 14000 \text{ d}$ at pH 7, $t_{1/2} = 0.14 \text{ d}$ at pH 12 in natural waters (Capel & Larson 1995)

$k(\text{exptl}) \leq 0.08 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} \geq 5 \text{ d}$ at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 3263\text{--}117520 \text{ h}$, based on estimated hydrolysis half-life pH 9 and 25°C (Mabey et al. 1983; quoted, Howard et al. 1991) and data from estimated unacclimated aerobic aqueous biodegradation half-life as well as a ground water die-away study in which no biodegradation was observed (Wilson et al. 1984; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 3263\text{--}8760 \text{ h}$, based on estimated hydrolysis half-life at pH 9 and 25°C (Mabey et al. 1983; quoted, Howard et al. 1991) and estimated unacclimated aerobic aqueous biodegradation half-life (Howard et al. 1991) and a soil column test in which no biodegradation was observed (Wilson et al. 1981; quoted, Howard et al. 1991).

Biota:

TABLE 5.1.1.9.1

Reported aqueous solubilities of 1,1,2-trichloroethane at various temperatures

$$S/(\text{wt}\%) = 0.48137 - 2.9594 \times 10^{-3} \cdot (t/^{\circ}\text{C}) + 4.3162 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 + 3.2190 \times 10^{-7} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 2.89796 - 1.8585 \times 10^{-2} \cdot (T/\text{K}) + 3.48961 \times 10^{-5} \cdot (T/\text{K})^2 \quad (2)$$

FIGURE 5.1.1.9.4 Logarithm of K_{OW} versus reciprocal temperature for 1,1,2-trichloroethane.

5.1.1.10 1,1,1,2-Tetrachloroethane

Common Name: 1,1,1,2-Tetrachloroethane

Synonym:

Chemical Name: 1,1,1,2-tetrachloroethane

CAS Registry No: 630-20-6

Molecular Formula: $\text{CH}_2\text{ClCCl}_3$

Molecular Weight: 167.849

Melting Point ($^{\circ}\text{C}$):

-70.2 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

130.2 (Lide 2003)

Density (g/cm^3 at 20°C):

1.5406 (Dreisbach 1961; Horvath 1982; Weast 1982–83)

1.5328 (25°C , Dreisbach 1961)

1.4819 (Dean 1985)

Molar Volume (cm^3/mol):

109.0 (20°C , calculated-density)

135.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

34.78, 42.18 (normal boiling point, 25°C , Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

1090* (20°C , shake flask, measured range 0 – 50°C , Van Arkel & Vles 1936)

1110 (Seidell 1940)

1100* (shake flask, temp range 10 – 80°C , Walraevens et al. 1974)

$\log [S/(\text{mol}/\text{L})] = 2070/(T/\text{K}) - 16.165 + 0.0236 \cdot (T/\text{K})$, temp range 283 – 353 K (Walraevens et al. 1974)

1100 (interpolation of literature values, Dilling 1977)

215, 200, 202 (3, 20, 34°C , shake flask-GC, Chiou & Freed 1977)

1110* (summary of literature data, temp range 0 – 80°C , Horvath 1982)

1206, 1280, 1292, 1321 (20, 30, 35, 40°C , infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

1178, 1382, 1492, 1607 (20, 30, 40°C , infinite dilution activity coeff. γ^{∞} -UNIFAC, Tse et al. 1992)

1005, 1093, 1056 (20, 30, 40°C , activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

1070* (recommended, temp range 0 – 50°C , IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(\text{wt}\%) = 2.17896 - 1.3966 \times 10^{-3} \cdot (T/\text{K}) + 2.93282 \times 10^{-5} \cdot (T/\text{K})^2$, temp range 273 – 323 K (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1767* (Antoine eq. regression, temp range 58 – 200°C , Stull 1947)

8851* (59.31°C , ebulliometry, measured range 59.31 – 130.2°C , Dreisbach & Shrader 1949)

1578 (calculated-Antoine eq., Dreisbach 1961)

$\log (P/\text{mmHg}) = 6.97560 - 1410.7/(214.0 + t/^{\circ}\text{C})$; temp range 43 – 174°C (Antoine eq. for liquid state, Dreisbach 1961)

1778 (calculated-Antoine eq., Weast 1972–73)

$\log (P/\text{mmHg}) = [-0.2185 \times 9296.5/(T/\text{K})] + 7.938042$; temp range -16.3 to 130.5°C (Antoine eq., Weast 1972–73)

1604 (calculated-Antoine eq., Boublik et al. 1973, 1984)

$\log(P/\text{mmHg}) = 6.89875 - 1365.876/(209.744 + t/^{\circ}\text{C})$; temp range 59–130°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1973)

1853 (20°C, interpolation of literature values, Dilling 1977)

$\log(P/\text{kPa}) = 6.02534 - 1366.919/(209.861 + t/^{\circ}\text{C})$; temp range 59.31–130.2°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)

$\log(P/\text{mmHg}) = 6.89875 - 1365.88/(209.74 + t/^{\circ}\text{C})$; temp range 59–130°C (Antoine eq., Dean 1985, 1992)

1578 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.1005 - 1410.7/(-59.15 + T/\text{K})$; temp range 316–417 K (Antoine eq., Stephenson & Malanowski 1987)

1201, 2120, 2765, 3575 (20, 30, 35, 40°C, quoted from DIPPR, Tse et al. 1992)

$\log(P/\text{mmHg}) = -1.0712 - 2.5074 \times 10^3/(T/\text{K}) + 6.1536 \cdot \log(T/\text{K}) - 1.8763 \times 10^{-2} \cdot (T/\text{K}) + 1.0462 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 203–624 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

272.7 (calculated-P/C, Dilling 1977)

283, 280 (calculated-P/C, recommended, Mackay & Shiu 1981)

172, 2, 284, 365, 486 (20, 30, 35, 40°C, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

196, 320, 560 (20, 30, 40°C, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

0.496, 0.80 (30, 40°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.03 (calculated, Müller & Klein 1992)

2.62, 2.62 (30, 40°C, infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 43$ min for the evaporation from dilute aqueous solution (Dilling et al. 1975)

Evaporation $t_{1/2}(\text{exptl}) = 42.3$ min, $t_{1/2}(\text{calc}) = 2.01$ min, 48.8 min from water (Dilling 1977)

Photolysis:

Oxidation:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} < 1.0 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time > 1160 d, loss $< 0.1\%$ in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

photooxidation $t_{1/2} = 2236\text{--}22361$ h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: $k = 1.2 \text{ M}^{-1} \text{ s}^{-1}$ for reaction at pH 7 and 25°C (Mabey et al. 1983; quoted, Howard et al. 1991);

$k = 4320 \text{ M}^{-1} \text{ h}^{-1}$ for base reaction at pH 9 and 25°C (Mabey et al. 1983; quoted, Howard et al. 1991);

abiotic hydrolysis or dehydrohalogenation $t_{1/2} = 384$ months (Mabey et al. 1983; quoted, Olsen & Davis 1990).

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320$ h, based on acclimated river die-away rate data for 1,1,2,2-tetrachloroethane (Mudder 1981; quoted, Howard et al. 1991), unacclimated sea water (Pearson & McConnell 1975; quoted, Howard et al. 1991) and sub-soil grab sample data for a ground water aquifer for 1,1,1-trichloroethane (Wilson et al. 1983; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688\text{--}17280$ h, based on aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h for the reaction with OH radical in air (USEPA 1974; quoted, Darnall et al. 1976)
residence time > 1160 d, loss $< 0.1\%$ in 1 d or 12 sunlit hours at 300 K in urban environments estimated as toxic chemical with OH radical (Singh et al. 1981)

$t_{1/2} = 2236\text{--}22361$ h, based on an estimated rate constant for the vapor phase reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991);

estimated tropospheric lifetime of 1.9 yr (Nimitz & Skaggs 1992).

Surface water: $t_{1/2} = 16\text{--}1604$ h, based on hydrolysis half-lives at pH 7 and 9 (Mabey et al. 1983; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 16\text{--}1604$ h, based on hydrolysis half-lives at pH 7 and 9 (Mabey et al. 1983; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 16\text{--}1604$ h, based on hydrolysis half-lives at pH 7 and 9 (Mabey et al. 1983; quoted, Howard et al. 1991).

Biota:

TABLE 5.1.1.10.1

Reported aqueous solubilities of 1,1,1,2-tetrachloroethane at various temperatures

$$S/(\text{wt}\%) = 0.11968 - 7.87116 \times 10^{-4} \cdot (t/^{\circ}\text{C}) + 1.42253 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 + 7.24354 \times 10^{-8} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 2.17896 - 1.3966 \times 10^{-3} \cdot (T/\text{K}) + 2.93282 \times 10^{-5} \cdot (T/\text{K})^2 \quad (2)$$

 2133 (McNally & Grob 1984)
 $\log(P/\text{mmHg}) = 6.6317 - 1228.1/(279.9 + t/^\circ\text{C})$; temp range 25–130°C (Antoine eq., Dean 1985, 1992)
 793 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.1295 - 1444.3/(205.1 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 793 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.1073 - 1465.1/(-62.15 + T/K)$; temp range 328–464 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 5.98931 - 1365.692/(-76.476 + T/K)$; temp range 377–419 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 440, 848, 1154, 2550 (20, 30, 35, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log(P/\text{mmHg}) = 56.2356 - 4.4615 \times 10^3/(T/K) - 1.6556 \cdot \log(T/K) - 3.5724 \times 10^{-10} \cdot (T/K) + 4.0425 \times 10^{-6} \cdot (T/K)^2$; temp range 229–645 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

46.2 (exptl. $1/K_{AW} (C_W/C_A)$, Hine & Mookerjee 1975)
 47.1 (calculated-P/C, Dilling 1977)
 35.38* (22.0°C, equilibrium cell-GC, measured range 11.0–27.2°C, Leighton & Calo 1981)
 48.5, 48.0 (calculated-P/C, recommended, Mackay & Shiu 1981)
 25.3* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 1.726 - 2810/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 38.5 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 33.45 (computed value, Yaws et al. 1991)
 30.4, 50.7, 60.8, 91.2 (20, 30, 35, 40°C, infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)
 40.3, 57.06, 120 (20, 30, 40°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 34.4 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 34.12 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 2.493 - 1255/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.56 (calculated as per Tute 1971, Callahan et al. 1979)
 2.39 (shake flask-LSC, Banerjee et al. 1980)

- 2.39 (shake flask-LSC, Veith et al. 1980)
 2.79, 2.84 (calculated-UNIFAC with octanol and water mutual solubility considered, calculated-UNIFAC with octanol and water mutual solubility not considered; Arbuckle 1983)
 2.39 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)
 2.93 (recommended, Sangster 1993)
 2.39 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

- 0.9–1.0 (bluegill sunfish, Barrows et al. 1980; Kawasaki 1980)
 0.90 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1982)
 1.96 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 0.91 (fathead minnow, Veith & Kosian 1982)
 2.03 (calculated- K_{OW} , McCarty et al. 1992)

Sorption Partition Coefficient, log K_{OC} :

- 1.66 (soil, equilibrium sorption isotherm, Chiou et al. 1979)
 1.90 (silt loam, quoted from Chiou et al. 1979; Karickhoff 1981; Howard 1990)
 2.00, 1.80, 1.87 (estimated- K_{OW} , estimated-S and mp, estimated-S, Karickhoff 1981)
 2.07 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
 3.60 (soil, calculated-universal solvation model; Winget et al. 2000)

Sorption Partition Coefficient, log K_{OM} :

- 1.66, 1.90 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constant, k, and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental $t_{1/2} = 56$ min for initial concentration of 1 mg/L when stirred at 200 rpm in water at approximately 25°C in an open container of depth 65 mm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982)

Evaporation $t_{1/2}(\text{exptl}) = 55.2$ min, $t_{1/2}(\text{calc}) = 12.0$ min, 40.5 min from water (Dilling 1977);

estimated $t_{1/2} \sim 6.3$ h for a model river of 1 m deep flowing at 1 m/s with a wind speed of 3 m/s, based on calculated Henry's law constant (Lyman et al. 1982; quoted, Howard 1990);

$t_{1/2} \sim 3.5$ d for a model pond was based on the effect of adsorption (USEPA 1987; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 2.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$k_{OH} < 1.0 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, estimated as toxic chemical residence time > 1160 d, loss < 0.1% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 213\text{--}2131$ h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991)

Hydrolysis: $k = 1.2 \times 10^{-7} \text{ h}^{-1}$ at 25°C and pH 7 (estimated, Mabey et al. 1982);

$t_{1/2}(\text{abiotic})$ or $t_{1/2}(\text{dehydrohalogenation}) = 10$ months (Mabey et al. 1983; quoted, Olsen & Davis 1990)

$t_{1/2}(\text{abiotic}) = 3.3$ months (Cooper et al. 1987; quoted, Olsen & Davis 1990);

$k = 2.3 \times 10^7 \text{ M}^{-1} \text{ yr}^{-1}$ at pH 9 and 25°C with $t_{1/2} = 1.1$ d in alkaline soil, and $k = 111$ d at pH 7 (Kollig et al. 1987; quoted, Howard 1990)

$k = 1.8 \text{ M}^{-1} \text{ s}^{-1}$ for base-catalyzed reaction at 25°C and pH 7 with $t_{1/2} = 45$ d; $k = 6480 \text{ M}^{-1} \text{ h}^{-1}$ for base reaction at pH 9 and 25°C; $k = (27.6 \pm 4.0) \times 10^{-8} \text{ s}^{-1}$ in sediment with 61% conversion (Haag & Mill 1988)

Biodegradation: $k = (7.3 \pm 0.1) \times 10^{-5} \text{ min}^{-1}$ with $t_{1/2} = 6.6$ d in sediment-water sample (Jafvert & Wolfe 1987)

$t_{1/2}(\text{abiotic}) > 800$ d for the reaction with photochemically produced hydroxyl radical (Singh et al. 1981; quoted, Howard 1990)

$t_{1/2}(\text{aq. aerobic}) = 672\text{--}4320$ h, based on acclimated river die-away rate data (Mudder 1981; quoted, Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 168\text{--}672$ h, based on anaerobic sediment grab sample data (Jafvert & Wolfe 1987) and anaerobic screening test data (Hallen et al. 1986; quoted, Howard et al. 1991).

Biotransformation: estimated rate constant of 3×10^{-12} mL cell⁻¹ h⁻¹ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 13.2$ h⁻¹ (flagfish, calculated-BCF $\times k_2$, McCarty et al. 1992)

$k_2 = 0.123$ h⁻¹ (flagfish, estimated-one compartment first-order kinetic, McCarty et al. 1992)

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h for the reaction with OH radical in air (USEPA 1974; quoted, Darnall et al. 1976); estimated as toxic chemical residence time > 1160 d, loss $< 0.1\%$ in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 213\text{--}2131$ h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Howard et al. 1991);

estimated tropospheric lifetime of 0.09 yr (Nimitz & Skaggs 1992).

Surface water: $t_{1/2} = 6.6$ d in sediment-water sample (Jafvert & Wolfe 1987);

$t_{1/2} = 45$ d at pH 7 and 25°C, based on base-catalyzed hydrolysis rate constant (Haag & Mill 1988);

$t_{1/2} = 10.7\text{--}1056$ h, based on hydrolysis half-lives at pH 7 and 9 (Howard et al. 1991).

Ground water: $t_{1/2} = 10.7\text{--}1056$ h, based on hydrolysis half-lives at pH 7 and 9 (Howard et al. 1991).

Sediment: $t_{1/2} = 6.6$ d in Bar-H sediment-water sample (Jafvert & Wolfe 1987);

measured $t_{1/2} = 29$ d at 25°C, based on neutral and base-catalyzed hydrolysis rates studies in pure water and in barely saturated subsurface sediment at 25–60°C (Haag & Mill 1988).

Soil: $t_{1/2} < 10$ d (Ryan et al. 1988);

$t_{1/2} = 10.7\text{--}1056$ h, based on hydrolysis half-lives at pH 7 and 9 (Howard et al. 1991).

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980);

$t_{1/2} < 10$ d, subject to plant uptake via volatilization (Ryan et al. 1988).

TABLE 5.1.1.11.1

Reported aqueous solubilities of 1,1,2,2-tetrachloroethane at various temperatures

$$\log S/(\text{mol/L}) = -15.316 + 2070/(T/K) + B(T/K) \quad (1)$$

$$S/(\text{wt}\%) = 0.32934 - 2.10434 \times 10^{-3} \cdot (t/^\circ\text{C}) + 2.54796 \times 10^{-5} \cdot (t/^\circ\text{C})^2 + 1.86126 \times 10^{-7} \cdot (t/^\circ\text{C})^3 \quad (2)$$

$$S/(\text{wt}\%) = 4.87975 - 3.0937 \times 10^{-3} \cdot (T/K) + 5.20513 \times 10^{-5} \cdot (T/K)^2 \quad (3)$$

5.1.1.12 Pentachloroethane

Common Name: Pentachloroethane

Synonym: 1,1,1,2,2-pentachloroethane, pentalin

Chemical Name: pentachloroethane

CAS Registry No: 76-01-7

Molecular Formula: C_2HCl_5 , $CHCl_2CCl_3$

Molecular Weight: 202.294

Melting Point ($^{\circ}C$):

-28.78 (Lide 2003)

Boiling Point ($^{\circ}C$):

162.0 (Horvath 1982; Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.6796 (Horvath 1982; Weast 1982–83)

1.6808, 1.6732 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

120 (calculated-density, Abernethy et al. 1988)

156.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

40.79, 36.941 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.34 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

345 (volumetric method, Wright & Schaffer 1932)

470 ($20^{\circ}C$, shake flask, Van Arkel & Vles 1936)

463 (Seidell 1940)

500 (data presented in graph, temp range 0 – $70^{\circ}C$, McGovern 1943)

500* (shake flask-GC, temp range 10 – $80^{\circ}C$, Walraevens et al. 1974)

$\log [S/(mol\ dm^{-3})] = 2070/(T/K) - 16.412 + 0.0230 \cdot (T/K)$; temp range 283 – $353\ K$ (Walraevens et al. 1974)

480 (literature average, Dilling et al. 1975; Dilling 1977)

776 (shake flask-LSC, Veith et al. 1980)

500* (summary of literature data, temp range 0 – $80^{\circ}C$, Horvath 1982)

500 (Dean 1985; Riddick et al. 1986)

470, 490 ($20^{\circ}C$, $25^{\circ}C$, recommended, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations Additional data at other temperatures designated * are compiled at the end of this section):

467* ($25.1^{\circ}C$, static method, measured range 25.1 – $162.2^{\circ}C$, Nelson 1930)

$\log (P/mmHg) = 7.80304 - 2129.6/(T/K)$; temp range 25.1 – $162.2^{\circ}C$ (static method, Nelson 1930)

596* (Antoine eq. regression, temp range 1.0 – $160.5^{\circ}C$, Stull 1947)

596 (calculated-Antoine eq., Weast 1972–73)

$\log (P/mmHg) = [-0.2185 \times 9800.1/(T/K)] + 7.832202$; temp range 1.0 – $160.6^{\circ}C$ (Antoine eq., Weast 1972–73)

465 (calculated-Antoine eq., Boublik et al. 1973)

$\log (P/mmHg) = 6.74011 - 1378.096/(197.367 + t/^{\circ}C)$; temp range 25.1 – $162^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1973)

600 (literature average, Dilling 1977)

453, 800 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

- 467 (calculated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 5.92765 - 1419.719/(202.285 + t/^{\circ}\text{C})$; temp range 25.1–162°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{mmHg}) = 6.740 - 1378/(197 + t/^{\circ}\text{C})$, temp range: 25–162°C (Antoine eq., Dean 1985, 1992)
 590 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 5.7199 - 1295.67/(188.96 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 625 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.69025 - 1982.65/(-10.577 + T/\text{K})$; temp range 274–434 K (Antoine eq., Stephenson & Malanowski 1987)
 467, 453 (quoted, calculated-UNIFAC, Banerjee et al. 1990)
 $\log(P/\text{mmHg}) = 72.1134 - 4.6522 \times 10^3/(T/\text{K}) - 23.777 \cdot \log(T/\text{K}) + 9.6908 \times 10^{-3} \cdot (T/\text{K}) - 3.3886 \times 10^{-13} \cdot (T/\text{K})^2$;
 temp range 244–665 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 247.9 (exptl $-1/K_{\text{AW}} = C_{\text{W}}/C_{\text{A}}$, Hine & Mookerjee 1975)
 247.9 (calculated-P/C, Dilling 1977)
 96.44 (calculated-QSAR, Nirmalakhandan & Speece 1988)
 196.5 (calculated-P/C, Howard 1990)
 188.9, 53.73 (quoted, calculated-bond contribution method, Meylan & Howard 1991)
 183.9 (computed value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 2.89 (shake flask-LSC, Veith et al. 1980)
 3.05 (HPLC-RT correlation, McDuffie 1981; quoted, Sangster 1993)
 3.22 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.826 (bluegill sunfish, Barrows et al. 1980)
 1.83 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1982)
 1.78 (fathead minnow, Veith & Kosian 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constant, k and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental $t_{1/2} = 48$ min for 1 mg/L aqueous solution when stirred at 200 rpm at approximately 25°C in an open container of depth 65 mm (Dilling et al. 1975)

Evaporation $t_{1/2}(\text{exptl}) = 46.5$ min, $t_{1/2}(\text{calc}) = 2.3$ min, 32 min from water (Dilling 1977)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}(\text{calc}) = 1.93 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{exptl}) = 2.33 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (SAR [structure-activity relationship], Kwok & Atkinson 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4$ –24 h from air for the reaction with OH radicals (USEPA 1974; quoted, Darnall et al. 1976);

estimated tropospheric lifetime of 0.58 h (Nimitz & Skaggs 1992).

Surface water:

Ground water:

Sediment:

Soil:

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980).

TABLE 5.1.1.12.1

Reported aqueous solubilities and vapor pressures of pentachloroethane at various temperatures

$$S/(\text{wt}\%) = 5.41068 \times 10^{-2} - 2.81268 \times 10^{-4} \cdot (t/^{\circ}\text{C}) + 3.41333 \times 10^{-6} \cdot (t/^{\circ}\text{C})^2 + 4.76167 \times 10^{-8} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$\log S = A/(T/K) - B + C \cdot (T/K) \quad (2)$$

FIGURE 5.1.1.12.2 Logarithm of vapor pressure versus reciprocal temperature for pentachloroethane.

5.1.1.13 Hexachloroethane

Common Name: Hexachloroethane

Synonym: carbon hexachloride, perchloroethane, phenohep, HCE

Chemical Name: hexachloroethane

CAS Registry No: 67-72-1

Molecular Formula: C_2Cl_6 , CCl_3CCl_3

Molecular Weight: 236.739

Melting Point ($^{\circ}C$):

186.8 (triple point) (Lide 2003)

Boiling Point ($^{\circ}C$):

184.7 (sublimation point) (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

2.091 (McGovern 1943; Horvath 1982; Weast 1982–83; Dean 1985)

Molar Volume (cm^3/mol):

113 (calculated-density, Abernethy et al. 1988; Wang et al. 1992)

177.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

50 ($22.3^{\circ}C$, shake flask, Van Arkel & Vles 1936)

50 ($22.3^{\circ}C$, McGovern 1943)

27.2 (shake flask-LSC, Veith et al. 1980)

50 ($22.3^{\circ}C$, recommended, Horvath 1982)

77.1 ($20^{\circ}C$, EPICS-LSC, Munz & Roberts 1986)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

42.7* (gas saturation method, extrapolated, measured range 31 – $55^{\circ}C$, Nelson 1930)

75.4* (extrapolated-Antoine eq. regression, temp range 32.7 – $186.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 11711.3/(T/K)] + 8.440623$; temp range 32.7 – $185.6^{\circ}C$ (Antoine eq., Weast 1972–73)

49.5 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 7.9015 - 3077/(T/K)$; temp range 317 – $345\ K$ (Antoine eq.-I, solid, rhombic, Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 7.856 - 2677/(T/K)$; temp range 345 – $460\ K$ (Antoine eq.-II, solid, cubic, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.6075 - 2103.6/(T/K)$; temp range 460 – $513\ K$ (Antoine eq., liquid, Stephenson & Malanowski 1987)

$\log(P/mmHg) = -366.2243 + 6.67893 \times 10^3/(T/K) + 155.63 \cdot \log(T/K) - 0.15563 \cdot (T/K) + 5.56 \times 10^{-5} \cdot (T/K)^2$; temp range 306 – $698\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

231.3 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

123.9 (calculated-P/C, Dilling 1977)

285* ($20^{\circ}C$, EPICS-LSC, measured range 10 – $30^{\circ}C$, Munz 1985)

$\log K_{AW} = 6.982 - 2320/(T/K)$, temp range 10 – $30^{\circ}C$ (EPICS-LSC measurements, Munz & Roberts 1987)

- 846* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm}\cdot\text{m}^3/\text{mol})] = 3.744 - 2550/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 253.3 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 226.7 (computed value, Yaws et al. 1991)
 285 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 6.982 - 2320/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 4.14 (20°C, shake flask-GC, both phases, Chiou et al. 1977)
 3.82 (HPLC- k' correlation, Könemann et al. 1979)
 3.93 (shake flask-LSC, Veith et al. 1980)
 4.05 (RP-HPLC-RT correlation, Veith et al. 1980)
 4.04 (HPLC-RT correlation, McDuffie 1981)
 4.14 (recommended, Sangster 1993)
 4.14 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 4.47 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 0.92–3.23 (calculated- K_{OW} , Veith et al. 1979, 1980)
 2.143 (bluegill sunfish, Barrows et al. 1980)
 2.14 (bluegill sunfish, Veith et al. 1980)
 3.83 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
 2.14 (bluegill sunfish, Veith & Kosian 1982)
 2.85 (fathead minnow, Veith & Kosian 1982)
 4.57 (calculated- K_{OW} , Thomann 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.3 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental $t_{1/2} = 40$ –45 min from dilute aqueous solution in open container of depth 65mm and stirring at 200 rpm (Dilling et al. 1975)

Evaporation $t_{1/2}(\text{exptl}) = 28.0$ min, $t_{1/2}(\text{calc}) = 4.5$ min, 24.5 min from water (Dilling 1977)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} < 1.0 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, estimated residence time > 11600 d, loss $\approx 0.0\%$ in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} > 7.3$ –73 yr, based on estimated maximum rate constant for the reaction with hydroxyl radical in air (Howard et al. 1991)

Hydrolysis: not significant, based on hydrolysis studies after 13 d at 85°C and pH 3, 7, and 11 (Ellington et al. 1987; quoted, Howard et al. 1991)

Biodegradation:

$k = (5.0 \pm 0.34) \times 10^{-2} \text{ min}^{-1}$ in Bar-H sediment-water slurry, $k = (2.0 \pm 0.17) \times 10^{-2} \text{ min}^{-1}$ in Beaver Dam sediment-water slurry, $k = (2.6 \pm 0.2) \times 10^{-2} \text{ min}^{-1}$ in Hickory Hill sediment-water slurry, $k = (1.9 \pm 0.16) \times 10^{-2} \text{ min}^{-1}$ in Memorial Park sediment-water slurry and $k = (1.9 \pm 0.1) \times 10^{-2} \text{ min}^{-1}$ with $t_{1/2} = 36$ min in anoxic Bar-H sediment-water suspension (Jafvert & Wolfe 1987)

$t_{1/2}(\text{aq. aerobic}) = 672$ h–4320 h, based on aqueous screening studies (Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 2688$ –17280 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 28$ d, $t_{1/2}(\text{anaerobic}) = 110$ d in natural waters (Capel & Larson 1995)

Biotransformation: estimated rate constant of $1 \times 10^{-10} \text{ ml cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

- Air: disappearance $t_{1/2} > 10$ d for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);
 $t_{1/2} > 7.3$ –73 yr, based on estimated maximum rate constant for reaction with hydroxyl radical (Singh et al. 1980; quoted, Howard et al. 1991);
 residence time > 11600 d, loss ≈ 0.0 in 1 d or 12 sunlit hours at 300 K in urban environments estimated as toxic chemical K for the reaction with OH radical (Singh et al. 1981)
- Surface water: $t_{1/2} = 36$ min in anoxic sediment-water suspension (Jafvert & Wolfe 1987);
 $t_{1/2} = 672$ –4320 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)
 $t_{1/2}(\text{aerobic}) = 28$ d, $t_{1/2}(\text{anaerobic}) = 110$ d in natural waters (Capel & Larson 1995).
- Ground water: $t_{1/2} = 1344$ –8640 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).
- Sediment: disappearance $k = (5.0 \pm 0.34) \times 10^{-2} \text{ min}^{-1}$ in Bar-H sediment-water slurry, $k = (2.0 \pm 0.17) \times 10^{-2} \text{ min}^{-1}$ in Beaver Dam sediment-water slurry, $k = (2.6 \pm 0.2) \times 10^{-2} \text{ min}^{-1}$ in Hickory Hill sediment-water slurry, $k = (1.9 \pm 0.16) \times 10^{-2} \text{ min}^{-1}$ in Memorial Park sediment-water slurry and $k = (1.9 \pm 0.1) \times 10^{-2} \text{ min}^{-1}$ with $t_{1/2} = 36$ min in Bar-H sediment-water suspension (Jafvert & Wolfe 1987)
- Soil: $t_{1/2} = 672$ –4320 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).
- Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980)

5.1.1.14 1-Chloropropane (*n*-Propyl chloride)

Common Name: 1-Chloropropane

Synonym: *n*-Propyl chloride, propyl chloride

Chemical Name: 1-chloropropane, *n*-Propyl chloride, propyl chloride

CAS Registry No: 540-54-5

Molecular Formula: $\text{CH}_3\text{CH}_2\text{CH}_2\text{Cl}$

Molecular Weight: 78.541

Melting Point ($^{\circ}\text{C}$):

−122.9 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

46.5 (Lide 2003)

Density (g/cm^3 at 20°C):

0.8909 (Dreisbach 1961; Horvath 1982)

0.8899, 0.8830 (20°C , 25°C , Riddick et al. 1986)

Molar Volume (cm^3/mol):

88.3 (20°C , calculated-density)

94.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

28.48, 27.25 (25°C , normal bp, Dreisbach 1961)

28.50, 27.24 (25°C , bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.544 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

2720* (20°C , measured range 0 – 30°C , volumetric method, Rex 1906)

2500 (Wright & Schaffer 1932)

2772 (30°C , shake flask, Van Arkel & Vles 1936)

2334 (Seidell 1941)

2333 (20°C , Saracco & Spaccamela Marchetti 1958)

2700 (20°C , Verschueren 1983)

2651* (summary of literature data, Horvath 1982)

2710 (20°C , quoted, Riddick et al. 1986)

2500* (reported value of IUPAC-NIST Solubility Data Series, temp range 0 – 37°C , Horvath & Getzen 1999)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

37360, 55240 (20°C , 30°C , Rex 1906)

46500* (interpolated-Antoine eq. regression, temp range -68.3 to 36.5°C , Stull 1947)

46000 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/\text{mmHg}) = 6.93111 - 1121.123/(230.2 + t/^{\circ}\text{C})$; temp range -25 to 88°C (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/\text{mmHg}) = 6.93111 - 1121.123/(230.20 + t/^{\circ}\text{C})$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

40517* (21.8°C , differential thermal analysis, measured range -25.1 to 47.1°C , Kemme & Kreps 1969)

$\log(P/\text{mmHg}) = [-0.2185 \times 7485.7/(T/\text{K})] + 8.028733$; temp range -63.8 to 46.4°C (Antoine eq., Weast 1972–73)

$\log(P/\text{kPa}) = 6.07206 - 1120.381/(229.061 + t/^{\circ}\text{C})$; temp range -25.1 to 47.1°C (Antoine eq. from reported exptl. data of Kemme & Kreps 1969, Boublik et al. 1984)

$\log(P/\text{mmHg}) = 6.92648 - 1110.19/(227.94 + t/^{\circ}\text{C})$; temp range -25 to 47°C (Antoine eq., Dean 1985, 1992)

45920 (selected, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.07655 - 1125.09/(229.86 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

46060 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.09145 - 1126.383/(-43.78 + T/\text{K})$; temp range 248–320 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 32.3325 - 2.485 \times 10^3/(T/\text{K}) - 8.8052 \cdot \log (T/\text{K}) + 8.9119 \times 10^{-11} \cdot (T/\text{K}) + 3.6803 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 150–503 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1341 (calculated-P/C, using Hine & Mookerjee 1975 data)

1600 (calculated-QSAR, Nirmalakhandan & Speece 1988)

1091 (computed value, Yaws et al. 1991)

1450 (γ^{∞} from gas stripping-GC, Li et al. 1993)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.04 (shake flask, Log P Database, Hansch & Leo 1987)

2.04 (recommended, Sangster 1989)

2.04 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

2.24 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (Darnall et al. 1976).

TABLE 5.1.1.14.1

Reported aqueous solubilities of 1-chloropropane at various temperatures

$$S/(\text{wt}\%) = 0.3746 - 0.007725 \cdot (t/^{\circ}\text{C}) + 1.05001 \times 10^{-6} \cdot (t/^{\circ}\text{C})^2 + 1.14998 \times 10^{-6} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

5.1.1.15 2-Chloropropane

Common Name: 2-Chloropropane

Synonym: isopropyl chloride

Chemical Name: 2-chloropropane, isopropyl chloride

CAS Registry No: 75-29-6

Molecular Formula: C_3H_7Cl , $CH_3CHClCH_3$

Molecular Weight: 78.541

Melting Point ($^{\circ}C$):

-117.18 (Lide 2003)

Boiling Point ($^{\circ}C$):

35.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8626, 0.8560 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959)

0.8617, 0.8563 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961; Riddick et al. 1986)

Molar Volume (cm^3/mol):

91.2 ($20^{\circ}C$, calculated from density)

94.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

26.86, 26.26 ($25^{\circ}C$, normal bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.39 (calculated, Dreisbach 1959)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

3050* ($20^{\circ}C$, measured range $0-30^{\circ}C$, volumetric method, Rex 1906)

3444 (shake flask, Fühner 1924)

3056 (Seidell 1940)

3000 (Seidell 1941)

2950 (selected exptl., Horvath 1982)

3400 (Dean 1985)

3040* ($20^{\circ}C$, tentative values, temp range $0-30^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

58050, 83940 ($20^{\circ}C$, $30^{\circ}C$, Rex 1906)

53329* ($18.1^{\circ}C$, summary of literature data, temp range -78.8 to $36.5^{\circ}C$, Stull 1947)

70580 (calculated-Antoine eq., Dreisbach 1959)

$\log(P/mmHg) = 6.96540 - 1081.6/(230 + t/^{\circ}C)$; temp range -32 to $90^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1959)

68700 (interpolated-Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = 6.91997 - 1081.4/(232 + t/^{\circ}C)$; temp range -33 to $68^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = [-0.2185 \times 6855.2/(T/K)] + 7.75768$; temp range -78.8 to $36.5^{\circ}C$ (Antoine eq., Weast 1972-73)

70000 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.91429 - 1593.593/(289.355 + t/^{\circ}C)$; temp range $0-30^{\circ}C$ (Antoine eq. from reported exptl. data of Rex 1906, Boublik et al. 1984)

69440 (interpolated-Antoine eq., temp range $0-30^{\circ}C$, Dean 1985, 1992)

$\log(P/mmHg) = 7.771 - 1582.0/(288.0 + t/^{\circ}C)$; temp range $0-30^{\circ}C$ (Antoine eq., Dean 1985, 1992)

68700 (selected, Riddick et al. 1986)

$\log(P/\text{kPa}) = 5.3643 - 779.7/(196.5 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

68800 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.54823 - 860.49/(-66.25 + T/\text{K})$; temp range 239–310 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/\text{mmHg}) = 115.1259 - 4.6278 \times 10^3/(T/\text{K}) - 42.197 \cdot \log(T/\text{K}) + 2.526 \times 10^{-2} \cdot (T/\text{K}) - 9.8906 \times 10^{-14} \cdot (T/\text{K})^2$; temp range 156–589 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1652 (calculated-P/C, using Hine & Mookerjee 1975 data)

1248 (calculated-QSAR, Nirmalakhandan & Speece 1988)

1468 (computed value, Yaws et al. 1991)

1836 (γ^∞ from gas stripping-GC, Li et al. 1993)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.69 (calculated- π const., Hansch et al. 1968)

1.90 (shake flask, Log P Database, Hansch & Leo 1987)

1.90 (recommended, Sangster 1989)

1.90 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Hydrolysis: rate constant $k = 2.12 \times 10^7 \text{ s}^{-1}$ with $t_{1/2} = 38 \text{ d}$ at 25°C and pH 7 (Mabey & Mill 1978)

Half-Lives in the Environment:

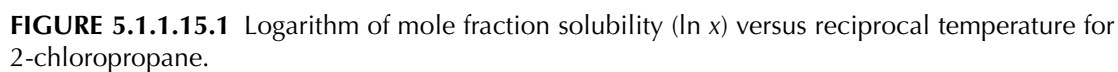

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radical (Darnall et al. 1976).

Surface water: $t_{1/2} = 38 \text{ d}$ at 25°C and pH 7 based on hydrolysis rate constant (Mabey & Mill 1978)

5.1.1.16 1,2-Dichloropropane

Common Name: 1,2-Dichloropropane

Synonym: propylene chloride, propylene dichloride, α,β -propylene dichloride

Chemical Name: 1,2-dichloropropane

CAS Registry No: 78-87-5

Molecular Formula: 1,2-C₃H₆Cl₂, CH₃CHClCH₂Cl

Molecular Weight: 112.986

Melting Point (°C):

−100.53 (Lide 2003)

Boiling Point (°C):

96.40 (McGovern 1943; Timmermans 1950; Weast 1982–83; Dean 1985; Lide 2003)

Density (g/cm³ at 20°C):

1.1560 (Dreisbach 1959, 1961; Horvath 1982; Weast 1982–83; Riddick et al. 1986)

1.1494 (25°C, Dreisbach 1959, 1961)

Molar Volume (cm³/mol):

98 (calculated-density, Abernethy et al. 1988; Wang et al. 1992)

115.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

36.33, 30.5 (25°C, normal bp, Dreisbach 1961)

36.40, 32.004 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.40 (calculated, Dreisbach 1959; quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

 $\log(P/\text{kPa}) = 6.08885 - 1295.9/(221.0 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 6620 (interpolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_1/\text{kPa}) = 6.08324 - 1292.64/(-52.52 + T/K)$; temp range 239–373 K (Antoine eq., Stephenson & Malanowski 1987)
 5410, 8790, 13790 (20, 30, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log(P/\text{mmHg}) = 5.4819 - 2.1918 \times 10^3/(T/K) + 2.6014 \cdot \log(T/K) - 1.1751 \times 10^{-2} \cdot (T/K) + 7.3435 \times 10^{-6} \cdot (T/K)^2$; temp range 173–572 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 298 (calculated- $1/K_{\text{AW}}$, $C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)
 31.21, 2261 (calculated-group contribution, calculated-bond contribution; Hine & Mookerjee 1975)
 280* (24.9°C, equilibrium cell-concn ratio-GC/FID, measured range 1.9–24.9°C, Leighton & Calo 1981)
 $\ln(k_{\text{H}}/\text{atm}) = 19.60 - 4333/(T/K)$; temp range: 1.9–24.9°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 210 (calculated-P/C, Mackay & Yuen 1983)
 286 (gas stripping-GC, Warner et al. 1987)
 362* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 9.843 - 4708/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 233 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 150 (computed value, Yaws et al. 1991)
 213, 324, 486 (20, 30, 40°C, infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)
 216, 347, 497 (20, 35, 50°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 3.37, 5.93 (35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 222 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 226.8 (20°C, exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)
 232 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{\text{AW}} = 4.878 - 1730/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)
 227.6* (EPICS-SPME, measured range 2–70°C, Görgényi et al. 2002)
 $\ln K_{\text{AW}} = 9.49 - 3494.7/(T/K)$; temp range 2–70°C (EPICS-SPME method, Görgényi et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 2.00 (Hansch & Leo 1979)
 1.98 (infinite dilution activity coeff.-GC, Tse & Sandler 1994)
 1.99* (infinite dilution activity coefficient determined by relative GC technique, measured range 25–50°C, Bhatia & Sandler 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.96 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

< 1.0 (fish, Kawasaki 1980; quoted, Howard 1990)

1.29 (calculated- K_{OW} , Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.43 (soil, equilibrium sorption isotherm, Chiou et al. 1979)

1.67 (silt loam soil, quoted from Chiou et al. 1979; Howard 1990)

1.70 (calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} < 50$ min in water from stirring in an open container of depth 65 mm at 200 rpm (Dilling et al. 1975; quoted, Mills et al. 1982);

$t_{1/2} = 8$ min from a stirred solution 1.6 cm deep (Chiou et al. 1980; quoted, Howard 1990);

$t_{1/2} = 1.7$ – 10 d, estimated from an EXAMS model of the fate of 1,2-dichloropropane in a pond, river, and two lakes (Burns 1981; quoted, Howard 1990);

$t_{1/2} = 8.3$ h at 1 m depth of stirred aqueous solution (Lyman et al. 1982; quoted, Howard 1990);

$t_{1/2} \sim 5.5$ h for the removal from a stream of 1 m depth with 1 m/s current, based on laboratory-determined relative transfer coefficients (Cadena et al. 1984; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 65$ – 646 h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991)

$k_{O_3}(aq.) \leq 0.004 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C , with a half-life of 100 d at pH 7 (Yao & Haag 1991).

Hydrolysis: $k = 5.0 \times 10^{-6} \text{ h}^{-1}$ at pH 7 to 9 and 25°C with a calculated $t_{1/2} = 15.8$ yr (Ellington et al. 1987; quoted, Ellington 1989; Howard et al. 1991).

Biodegradation: aerobic $t_{1/2}(aq.) = 4008$ – 30936 h, based on acclimated aerobic soil grab sample data (Roberts & Stoydin 1976; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2}(aq.) = 16032$ – 123744 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4$ – 24 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 65$ – 646 h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991);

$t_{1/2} > 23$ d, reaction with photochemically produced OH radical (Howard 1990).

Surface water: $t_{1/2} = 4008$ – 30936 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991); measured rate constant $k \leq 0.004 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C , with $t_{1/2} \geq 100$ d at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 8016$ – 61872 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 4008$ – 30936 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.1.17 1,2,3-Trichloropropane

Common Name: 1,2,3-Trichloropropane

Synonym:

Chemical Name: 1,2,3-trichloropropane

CAS Registry No: 96-18-4

Molecular Formula: 1,2,3-C₃H₃Cl₃, CH₂ClCHClCH₂Cl

Molecular Weight: 147.431

Melting Point (°C):

-14.7 (Weast 1982–83; Dean 1985; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point (°C):

157 (Lide 2003)

Density (g/cm³ at 20°C):

1.3888 (Dreisbach 1961; Horvath 1982; Weast 1982–83)

1.3832 (25°C, Dreisbach 1961; Riddick et al. 1986)

Molar Volume (cm³/mol):

136.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

46.93, 37.12 (25°C, normal bp, Dreisbach 1961; Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated):

1900 (20°C, literature average, Dilling 1977)

1896 (recommended, Horvath 1982)

1900 (selected, Riddick et al. 1986)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations):

492 (extrapolated-Antoine eq., Dreisbach 1961)

log (P/mmHg) = 6.98716 – 1502.3/(209.0 + t/°C); temp range 64–204°C (Antoine eq. for liquid state, Dreisbach 1961)

log (P/mmHg) = [–0.2185 × 10714.3/(T/K)] + 8.326893; temp range 9.0–158°C (Antoine eq., Weast 1972–73)

266.6, 533.2 (20°C, 30°C, Verschuereen 1983)

492.0 (calculated-Antoine eq., Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.11206 – 1502.3/(–64.15 + T/K); temp range 337–477 K (Antoine eq., Stephenson & Malanowski 1987)

413, 960 (quoted, calculated-solvatochromic parameters. and UNIFAC, Banerjee et al. 1990)

log (P/mmHg) = –3.9501 – 2.4501 × 10³/(T/K) + 6.6887 · log (T/K) – 1.4991 × 10^{–2} · (T/K) + 7.3403 × 10^{–6} · (T/K)²; temp range 258–652 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

32.22 (calculated-C_A/C_w, Dilling 1977)

36.1* (24.9°C, equilibrium cell-concn ratio-GC/FID, measured range 1.9–24.9°C, Leighton & Calo 1981)

ln (k_H/atm) = 14.61 – 3477/(T/K); temp range: 1.9–24.9°C (equilibrium cell-concn ratio, Leighton & Calo 1981)

24.91* (25.6°C, EPICS-GC, tap water, measured range 25.6–45°C, Tancrede & Yanagisawa 1990)

log K_{AW} = 3.351 – 1606/(T/K); temp range 26.5–45°C (EPICS measurements, Tancrede & Yanagisawa 1990)

34.4 (computed value, Yaws et al. 1991)

22.31 (interpolated from Tancrede & Yanagisawa 1990, Tancrede et al. 1992)

23.71 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 22.74 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{AW} = 3.073 - 1496/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.63 (estimated, Abernethy et al. 1988)
 1.98 (quoted, Van Leeuwen et al. 1992; Verhaar et al. 1992)
 2.25, 2.36 (quoted, calculated-molar volume, Wang et al. 1992)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

1.98; 1.89; 1.92 (Captina silt loam, OC 1.49%, pH 4.97; McLaurin sandy loam, OC 0.66%, pH 4.43, batch equilibrium-sorption isotherm, Walton et al. 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: evaporation $t_{1/2} = 51$ min from dilute aqueous solution (Dilling 1975)

Evaporation $t_{1/2}(\text{exptl}) = 56.1$ min, $t_{1/2}(\text{calc}) = 18$ min, 44.7 min from water (Dilling 1977)

Photolysis:

Oxidation: photooxidation $t_{1/2} = 61\text{--}613$ h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: $k = 1.8 \times 10^{-6} \text{ h}^{-1}$ at pH 7 to 9 at 25°C with a calculated $t_{1/2} = 44$ yr (Ellington et al. 1987; quoted, Ellington 1989; Howard et al. 1991).

Biodegradation: aerobic $t_{1/2}(\text{aq.}) = 4320\text{--}8640$ h, based on acclimated aerobic grab sample test data for 1,3-dichloropropane (Roberts & Stoydin 1976; quoted, Howard et al. 1991); anaerobic $t_{1/2}(\text{aq.}) = 17280\text{--}34560$ h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 61\text{--}613$ h, based on an estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 8640\text{--}17280$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: disappearance $t_{1/2} = 2.7$ d was calculated from first-order kinetic for volatilization loss of mixtures in soils (Anderson et al. 1991);

$t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

FIGURE 5.1.1.18.3 Logarithm of vapor pressure versus reciprocal temperature for 1-chlorobutane.

5.1.1.19 2-Chlorobutane

Common Name: 2-Chlorobutane

Synonym: methylethylchloromethane, *sec*-butyl chloride

Chemical Name: 2-chlorobutane, methylethylchloromethane, *sec*-butyl chloride

CAS Registry No: 78-86-4

Molecular Formula: C_4H_9Cl , $CH_3CH_2CHClCH_3$

Molecular Weight: 92.567

Melting Point ($^{\circ}C$):

−131.3 (Dreisbach 1961; Horvath 1982; Lide 2003)

−113.3, −140.5 (racemic, active, Riddick et al. 1986)

Boiling Point ($^{\circ}C$):

68.25 (Dreisbach 1961; Horvath 1982; Riddick et al. 1986)

68.2 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8732, 0.8677 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961; Horvath 1982; Dean 1985)

0.8732 (racemic, Riddick et al. 1986)

Molar Volume (cm^3/mol):

117.1 (calculated-Le Bas method at normal boiling point)

106.0 ($20^{\circ}C$, calculated-density)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

31.81, 29.20 ($25^{\circ}C$, bp, Dreisbach 1961)

31.56, 29.20 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1000 (volumetric method, Wright & Schaffer 1932)

1000 (Dean 1985; Riddick et al. 1986)

1070, 930, 850, 820, 840, 920 (0, 5, 10, 15, 20, $35^{\circ}C$, tentative values, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999)

$S/(wt\%) = 8.9653 - 0.061598 \cdot (T/K) + 1.0678 \times 10^{-4} \cdot (T/K)^2$, temp range 273–298 K (equation derived from reported solubility data, Horvath & Getzen 1999)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

20210 (interpolated-Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = 6.94469 - 1195.8/(226.0 + t/^{\circ}C)$; temp range -7 to $104^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = [-0.2185 \times 7407.9/(T/K)] + 7.625620$; temp range -60.2 to $68^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log(P/mmHg) = 6.79923 - 1149.12/(224.68 + t/^{\circ}C)$; temp range 0 – $40^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P/kPa) = 6.1222 - 1145.2/(234.4 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

20200 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.06958 - 1195.8/(-47.15 + T/K)$; temp range 266–377 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 28.2992 - 2.4355 \times 10^3/(T/K) - 7.359 \cdot \log(T/K) - 1.3048 \times 10^{-11} \cdot (T/K) + 3.0834 \times 10^{-6} \cdot (T/K)^2$; temp range 142–521 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2268* ($24.9^{\circ}C$, equilibrium cell-concn ratio-GC/FID, measured range 1.9 – $24.9^{\circ}C$, Leighton & Calo 1981)

$\ln(k_H/atm) = 22.29 - 4499/(T/K)$; temp range 1.9 – $24.9^{\circ}C$ (equilibrium cell-concn ratio, Leighton & Calo 1981)

1869 (computed value, Yaws et al. 1991)

1886 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 6.129 - 1829/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.51 (calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radicals (Darnall et al. 1976).

5.1.1.20 1-Chloropentane (*n*-Amyl chloride)

Common Name: 1-Chloropentane

Synonym: *n*-amyl chloride, monochloropentane, pentyl chloride

Chemical Name: *n*-amyl chloride, 1-chloropentane, pentyl chloride

CAS Registry No: 543-59-9

Molecular Formula: $C_5H_{11}Cl$, $CH_3CH_2CH_2CH_2CH_2Cl$

Molecular Weight: 106.594

Melting Point ($^{\circ}C$):

−99.0 (Dreisbach 1961; Horvath 1982; Riddick et al. 1982; Dean 1985; Lide 2003)

Boiling Point ($^{\circ}C$):

108.4 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8818 ($20^{\circ}C$, Weast 198–83; Horvath 1982)

0.8820, 0.8770 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

120.9 ($20^{\circ}C$, calculated-density)

139.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

38.24, 32.77 ($25^{\circ}C$, bp, Dreisbach 1961; Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

200 (volumetric method, Wright & Schaffer 1932)

789 (shake flask-residue volume method, Booth & Everson 1948)

190.6* ($24.3^{\circ}C$, converted-distribution coeff., temp range 2.5 – $26.1^{\circ}C$, Leighton & Calo 1981)

198.2* (summary of literature data, Horvath 1982)

200 (Dean 1985; Riddick et al. 1986)

201* (tentative values, measured range 5 – $35^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999b)

$S/(wt\%) = 0.55726 - 3.7269 \times 10^{-3} \cdot (T/K) + 6.457 \times 10^{-6} \cdot (T/K)^2$, temp range 276 – $310\ K$ (equation derived from reported solubility data, Horvath & Getzen 1999b)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4142 (calculated-Antoine eq, Dreisbach 1961)

$\log (P/mmHg) = 6.96617 - 1332.890/(218.5 + t/^{\circ}C)$; temp range 24 – $148^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = 6.96617 - 1332.890/(218.50 + t/^{\circ}C)$; pressure range 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

4142 (selected, Riddick et al. 1986)

$\log (P/kPa) = 5.93641 - 1271.15/(215.0 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

4148 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.09107 - 1332.89/(T/K - 54.65)$; temp range 289 – $409\ K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/mmHg) = -4.4886 - 2.2604 \times 10^3/(T/K) + 7.8088 \cdot \log (T/K) - 2.3675 \times 10^{-2} \cdot (T/K) + 1.4884 \times 10^{-5} \cdot (T/K)^2$; temp range 174 – $568\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2209 (exptl.- $1/K_{\text{AW}} = C_{\text{W}}/C_{\text{A}}$, Hine & Mookerjee 1975)

2480, 13010 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

2376* (24.3°C , equilibrium cell-concn ratio-GC/FID, measured range 2.5 – 26.1°C , Leighton & Calo 1981)

$\ln(k_{\text{H}}/\text{atm}) = 23.04 - 4727/(T/\text{K})$; temp range 2.5 – 26.1°C (equilibrium cell-concn ratio, Leighton & Calo 1981)

4942 (computed value, Yaws et al. 1991)

2407 (activity coefficient γ^∞ from gas stripping-GC, Li et al. 1993)

1835 (20°C , selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)

$\log K_{\text{AW}} = 6.455 - 1928/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.41 (calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4$ – 24 h from air for the reaction with OH radical (Darnall et al. 1976).

5.1.1.21 1-Chlorohexane

Common Name: 1-Chlorohexane

Synonym: *n*-hexyl chloride

Chemical Name: 1-chlorohexane

CAS Registry No: 544-10-5

Molecular Formula: C₆H₁₃Cl

Molecular Weight: 120.620

Melting Point (°C):

−94 (Dreisbach 1961; Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point (°C):

135.1 (Lide 2003)

Density (g/cm³):

0.8785; 0.8739 (20°C, 25°C, Dreisbach 1961)

0.8785 (20°C, Weast 1982–83)

Molar Volume (cm³/mol):

137.7 (20°C, calculated-density, Stephenson & Malanowski 1987)

161.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

43.22, 35.39 (25°C, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

83.6 (volumetric method, Wright & Schaffer 1932)

57.93* (23.0°C, converted-distribution coeff., temp range 1.0–23.0°C, Leighton & Calo 1981)

91.01* (summary of literature data, Horvath 1982)

54.3* (tentative values, measured range 5–25°C, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999b)

$S/(\text{wt}\%) = -0.019959 + 8.852 \times 10^{-5} \cdot (T/K)$, temp range 274–296 K (equation derived from reported solubility data, Horvath & Getzen 1999b)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1284 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/\text{mmHg}) = 7.0115 - 1437.05/(213.4 + t/^\circ\text{C})$; temp range 46–178°C (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/\text{mmHg}) = 7.0115 - 1437.05/(213.4 + t/^\circ\text{C})$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

1387* (26.7°C, differential thermal analysis, measured range 15–135.6°C, Kemme & Kreps 1969)

$\log(P/\text{mmHg}) = 6.76886 - 1304.968/(t/^\circ\text{C} + 200.058)$; temp range 15–135.6°C (Antoine eq. on exptl. data, differential thermal analysis, Kemme & Kreps 1969)

1230 (interpolated-Antoine eq., Boublik et al. 1973)

$\log(P/\text{mmHg}) = 7.05136 - 1461.72/(t/^\circ\text{C} + 136.92)$; temp range 15–136°C (Antoine eq. based on exptl. data of Kemme & Kreps 1969, Boublik et al. 1973)

1246 (interpolated, Antoine eq., Stephenson & Malanowski 1987)

$\log(P/\text{kPa}) = 5.89376 - 1304.968/(T/K - 73.092)$; temp range: 288–409 K (Antoine eq., Stephenson & Malanowski 1987)

1260 (interpolated-Antoine eq., Dean 1992)

$\log(P/\text{mmHg}) = 7.05136 - 1461.72/(t/^\circ\text{C} + 215.57)$; temp range 15–136°C (Antoine eq., Dean 1992)

5.1.1.22 1-Chloroheptane

Common Name: 1-Chloroheptane

Synonym: heptyl chloride

Chemical Name: 1-chloroheptane

CAS Registry No: 629-06-1

Molecular Formula: $C_7H_{15}Cl$

Molecular Weight: 134.647

Melting Point ($^{\circ}C$):

-69.5 (Dreisbach 1961; Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

160.4 (Lide 2003)

Density (g/cm^3):

0.8758, 0.8715 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961)

0.8758 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

153.7 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

183.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

48.19, 37.95 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

13.6 (generator column-GC/FID, Tewari et al. 1982; Miller et al. 1985)

13.6 (tentative value, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999b)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

404 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = 7.0650 - 1539.35/(208.8 + t/^{\circ}C)$; temp range 67 – $206^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = 7.0650 - 1539.35/(208.8 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

680* ($34.4^{\circ}C$, differential thermal analysis, measured range 34.4 – $160^{\circ}C$, Kemme & Kreps 1969)

$\log(P/mmHg) = 6.83820 - 1410.064/(t/^{\circ}C + 195.639)$; temp range 34.4 – $160.1^{\circ}C$ (Antoine eq. on exptl. data, differential thermal analysis, Kemme & Kreps 1969)

336.6 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.05057 - 1459.652/(t/^{\circ}C + 160.428)$; temp range 34.4 – $160^{\circ}C$ (Antoine eq. based on exptl. data of Kemme & Kreps 1969, Boublik et al. 1984)

$\log(P_L/kPa) = 6.9631 - 1410.064/(T/K - 77.511)$; temp range 307–434 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 6.91670 - 1453.96/(t/^{\circ}C + 199.83)$; temp range 36 – $160^{\circ}C$ (Antoine eq., Dean 1992)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.08 (calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

1100 (Verschuereen 1977, 1983)

6800 ($20^{\circ}C$, selected, Nathan 1978)

8700* (restatement of Hayduk & Laudie 1974, temp range 0.2 – $75^{\circ}C$ at saturated pressure of vinyl chloride, DeLassus & Schmidt 1981)

8800* ($26^{\circ}C$, solubility bomb-headspace GC, measured range 15 – $85^{\circ}C$ at saturated pressure of vinyl chloride, DeLassus & Schmidt 1981)

2763* (recommended, temp range 0 – $175^{\circ}C$, Horvath 1982)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

538000* (Antoine eq. regression, temp range -105.6 to $-13.8^{\circ}C$, Stull 1947)

354600 (calculated-Antoine eq., Dreisbach 1959)

$\log(P/mmHg) = 6.49712 - 783.4/(230.0 + t/^{\circ}C)$, temp range -100 to $50^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1959)

104698* ($-13.00^{\circ}C$, ebulliometry, measured range -64.9 to $-13.00^{\circ}C$, McDonald et al. 1959)

381600 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = 6.88054 - 912.5/(242.0 + t/^{\circ}C)$; temp range -73 to $46^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = 6.86108 - 892.757/(238.099 + t/^{\circ}C)$; temp range -64.9 to $13.0^{\circ}C$ (Antoine eq. from ebulliometric measurements, McDonald et al. 1959)

- 172719* (0°C, temp range -59.4 to 0°C, Huccura & Mathieu 1967)
 546800 (calculated-Antoine eq., Weast 1972-73)
 $\log (P/\text{mmHg}) = [-0.2185 \times 6263.0/(T/K)] + 8.202782$; temp range -105.1 to -13.8°C (Antoine eq., Weast 1972-73)
 392800 (calculated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 6.89117 - 905.008/(239.475 + t/^\circ\text{C})$; temp range -64.9 to -13.0°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 309300 (Pearson & McConnell 1975)
 $\log (P/\text{mmHg}) = 6.89117 - 905.01/(239.48 + t/^\circ\text{C})$; temp range -657 to -13°C (Antoine eq., Dean 1985, 1992)
 $\log (P/\text{kPa}) = 5.98598 - 892.757/(238.099 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 387000 (interpolated-Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 5.98598 - 892.757/(-35.051 + T/K)$; temp range 208-260 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 5.20198 - 556.26/(-85.385 + T/K)$; temp range 259-328 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 52.9654 - 2.5016 \times 10^3/(T/K) - 17.914 \cdot \log (T/K) + 1.0821 \times 10^{-2} \cdot (T/K) - 4.531 \times 10^{-14} \cdot (T/K)^2$; temp range 119-432 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 5680 (exptl.-1/K_{AW} = C_w/C_A, Hine & Mookerjee 1975)
 4723 (calculated-bond contribution method, Hine & Mookerjee 1975)
 117705 (10°C, Pearson & McConnell 1975)
 39660 (calculated-P/C, Neely 1976)
 106590 (calculated-P/C, Dilling 1977)
 2350 (calculated-P/C, Mackay & Shiu 1981)
 2817* (24.8°C, EPICS-GC/FID, measured range 10.3-34.6°C, Gossett 1987)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 7.385 - 3286/(T/K)$; temp range 10.3-34.6°C (EPICS measurements, Gossett 1987)
 2685* (EPICS-GC/FID, measured range 10-30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 6.138 - 2931/(T/K)$; temp range 10-30°C (EPICS measurements, Ashworth et al. 1988)
 2271 (computed value, Yaws et al. 1991)
 2172 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 4.119 - 1223/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 1.39 (calculated- π substituent const., Hansch et al. 1968)
 0.60 (Callahan et al. 1979; Mills et al. 1982)
 1.23 (calculated-fragment const., Mabey et al. 1982)
 2.79 (Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 0.845 (estimated-S, Lyman et al. 1982)
 0.756 (microorganisms-water, calculated-K_{OW}, Mabey et al. 1982)
 3.04, 1.60, < 1.0 (activated sludge, *Chlorella fusca*, golden ide, Freitag et al. 1984)
 0.068 (from USEPA 86, Yeh & Kastenbergs 1991)

Sorption Partition Coefficient, $\log K_{OC}$:

- 0.9138 (sediment-water, calculated-K_{OW}, Mabey et al. 1982)
 1.748 (estimated-S, Lyman et al. 1982)
 0.477 (soil, selected, Jury et al. 1990)
 1.756 (quoted from USEPA 1986, Yeh & Kastenbergs 1991)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 25$ min from water, by rapidly stirring aqueous solutions in an open container of depth 65 mm at 200 rpm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982)

$t_{1/2}(\text{exptl}) = 27.6$ min, $t_{1/2}(\text{calc}) = 0.0054$ min, 16.1 min from water at 10°C (Dilling 1977)

$t_{1/2} \sim 0.805$ h for volatilization from a river of 1-m deep with a current of 3 m/s and wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1989);

estimated $t_{1/2} \sim 2.5$ h from water (Thomas 1982);

volatilization $t_{1/2} = 0.2$ to 0.5 d from soil at 1 and 10 cm incorporation (Jury et al. 1984);

$t_{1/2} = 30$ d, estimated volatilization from soil (Jury et al. 1990).

Photolysis: degrade rapidly in air by reaction with photochemically produced hydroxyl radicals with an estimated $t_{1/2} = 1.5$ d (Perry et al. 1977; quoted, Howard 1989).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}} = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 26°C (Perry et al. 1977)

photooxidation $t_{1/2}$ was reported to be a few hours in the troposphere (Callahan et al. 1979)

$k_{\text{OH}} = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1979, 1982; quoted, Atkinson & Carter 1984; Tuazon et al. 1984)

$k_{\text{O}_3} = 6.5 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (Sanhueza et al. 1976; quoted, Atkinson & Carter 1984)

$k_{\text{O}_3} = 2.3 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Gay et al. 1976; quoted, Atkinson & Carter 1984)

$k_{\text{O}_3} = 2.5 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1979, 1982; quoted, Atkinson & Carter 1984; Tuazon et al. 1984; Atkinson et al. 1987)

$k_{\text{OH}} = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 1.8 d, loss of 42.6% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{\text{OH}}(\text{calc}) = 3.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{O}_3} = 1.2 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 300 K (Lyman 1982)

$k < 10^8 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $3.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

$k_{\text{O}_3} = (2.45 \pm 0.45) \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Zhang et al. 1983; quoted, Atkinson & Carter 1984)

$k_{\text{O}_3} = 2.5 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}} = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Tuazon et al. 1984)

$k_{\text{NO}_3} = (1.4 \pm 0.9) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 1 K (Andersson & Ljungström 1989)

photooxidation $t_{1/2} = 9.7\text{--}97$ h, based on measured rate constant for the reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k_{\text{OH}}(\text{calc}) = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1985)

$k_{\text{NO}_3} = (2.3 \pm 1.1) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ relative to ethene at 298 ± 2 K (relative rate method, Atkinson et al. 1987; quoted, Atkinson 1991)

$k_{\text{NO}_3} = 2.30 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculate atmospheric lifetime $\tau = 42$ d, and $k_{\text{OH}} = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with $\tau(\text{calc}) = 3.5$ d and $k_{\text{O}_3} = 2.5 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with $\tau(\text{calc}) = 66$ d at room temp. (Atkinson et al. 1987)

$k_{\text{OH}}(\text{calc}) = 5.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1987)

$k_{\text{NO}_3} = (3.30 \pm 1.66) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 1 K (quoted from Anderson & Ljungström 1989, Atkinson 1991)

$k_{\text{NO}_3} = 4.45 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Sabljic & Güsten 1990)

$k_{\text{NO}_3} = 4.3 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = 5.25 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (as per Atkinson 1987 and 1988, Müller & Klein 1991)

Hydrolysis: $t_{1/2} < 10$ yr (Callahan et al. 1979);

estimated acid-catalyzed rate constant of $3.30 \times 10^{-12} \text{ mol}^{-1} \text{ s}^{-1}$ at pH 5 with calculated $t_{1/2} = 2 \times 10^{11}$ d (Wolfe 1980; quoted, Ma et al. 1990)

abiotic hydrolysis or dehydrohalogenation $t_{1/2} < 120$ months (Olsen & Davis 1990).

Biodegradation: abiotic degradation rate constant of $k = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 26°C determined in laboratory experiments for the vapor phase reaction with hydroxyl radicals (Perry et al. 1977; quoted, Howard 1989)

$t_{1/2}(\text{aq. aerobic}) = 672\text{--}4320$ h, based on aqueous screening test data (Freitag et al. 1984; Helfgott et al. 1977; quoted, Howard et al. 1991)

greater than 99% degraded after 108 d under aerobic conditions and approximately 65% being mineralized to $^{14}\text{CO}_2$ under aerobic conditions (Davis & Carpenter 1990);

$t_{1/2}(\text{aq. anaerobic}) = 2688\text{--}17280$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$t_{1/2} > 60$ d (Olsen & Davis 1990)

$t_{1/2}(\text{aerobic}) = 28$ d, $t_{1/2}(\text{anaerobic}) = 110$ d in natural waters (Capel & Larson 1995).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 11$ wk, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 0.24\text{--}2.4$ h from air for the reaction with OH radical (Darnall et al. 1976);

photodecomposition $t_{1/2} = 4.3$ h with NO under simulated atmospheric conditions (Dilling et al. 1976);
estimated $t_{1/2} = 1.5$ d, based on its photochemical reaction with OH radical in air (Perry et al. 1977; quoted, Howard 1989);

residence time of 1.8 d, loss of 42.6% in 1 d or 12 sunlit hours at 300 K in urban environments estimated as toxic chemical for the reaction with OH radical (Singh et al. 1981)

$t_{1/2} = 9.7\text{--}97$ h, based on measured rate for the reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);

atmospheric lifetimes $\tau = 42$ d for the reaction with NO_3 radical for a 12-h nighttime, average concn. of 2.4×10^9 molecule/ cm^3 , $\tau = 3.5$ d for the reaction with OH radical for a 12-h average concn. of 1.0×10^6 molecule/ cm^3 , and $\tau = 66$ d for the reaction with O_3 for a 24-h, average concn. of 7×10^{11} molecule/ cm^3 (Atkinson et al. 1987).

Surface water: estimated $t_{1/2} = 0.805$ h for volatilization from a river of 1 m deep with a current of 3 m/s and a wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1989);

$t_{1/2} = 672\text{--}4320$ h, based on aqueous screening test data (Freitag et al. 1984; Helfgott et al. 1977; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}69000$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life and an estimated half-life for anaerobic biodegradation from a ground water field study of chlorinated ethenes (Silka & Wallen 1988; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} < 10$ d (Ryan et al. 1988);

$t_{1/2} = 0.2$ to 0.5 d for volatilization from soil at 1 and 10 cm incorporation (Jury et al. 1984; quoted, Howard 1989);

$t_{1/2} = 30$ d, estimated volatilization loss from soil (Jury et al. 1990);

$t_{1/2} = 30\text{--}180$ d (Howard et al. 1991; quoted, Jury et al. 1992);

$t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $t_{1/2} < 10$ d, subject to plant uptake via volatilization (Ryan et al. 1988; quoted, Jury et al. 1992).

5.1.1.27 1,1-Dichloroethene

Common Name: 1,1-Dichloroethene

Synonym: 1,1-dichloroethylene, vinylidene chloride, vinylidine chloride, 1,1-DCE

Chemical Name: 1,1-dichloroethene, 1,1-dichloroethylene

CAS Registry No: 75-35-4

Molecular Formula: $C_2H_2Cl_2$, $CH_2 = CCl_2$

Molecular Weight: 96.943

Melting Point ($^{\circ}C$):

-122.56 (Lide 2003)

Boiling Point ($^{\circ}C$):

31.6 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.2180 (Horvath 1982; Weast 1982-83; Verschuereen 1983)

1.2132 (Riddick et al. 1986)

Molar Volume (cm^3/mol):

79.9 ($20^{\circ}C$, calculated-density)

86.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

26.49, 28.18 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

6.514 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

400 ($20^{\circ}C$, shake flask-GC, McConnell et al. 1975; Pearson & McConnell 1975)

400 ($20^{\circ}C$, literature average, Dilling 1977)

2250* (solubility bomb-headspace GC, measured range $15-90.5^{\circ}C$, DeLassus & Schmidt 1981)

210* (summary of literature data, Horvath 1982)

2640, 3675 ($20^{\circ}C$, $30^{\circ}C$, saturation concn., Verschuereen 1983)

2232 ($30^{\circ}C$, headspace-GC, McNally & Grob 1984)

210 (Dean 1985; Riddick et al. 1986)

2843, 2790, 2782 (20 , 30 , $40^{\circ}C$, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

2420* (recommended, temp range $0-90^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(wt\%) = 6.27413 - 3.8257 \times 10^{-2} \cdot (T/K) + 6.04607 \times 10^{-5} \cdot (T/K)^2$, temp range $288-363 K$ (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

86430* (Antoine eq. regression, temp range -77.2 to $31.7^{\circ}C$, Stull 1947)

97241* ($30.39^{\circ}C$, ebulliometry, measured range -28.36 to $32.50^{\circ}C$, Hildebrand et al. 1959)

84500 (calculated-Antoine eq., Weast 1972-73)

$\log (P/mmHg) = [-0.2185 \times 7211.8/(T/K)] + 8.087140$; temp range -77.2 to $31.7^{\circ}C$ (Antoine eq., Weast 1972-73)

80040 (calculated-Antoine eq., Boublik et al. 1973)

$\log (P/mmHg) = 6.97215 - 1099.446/(237.184 + t/^{\circ}C)$; temp range -28 to $32.5^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1973)

79710 (literature average, Dilling 1977)

78780 (Verschuereen 1977, 1983)

- 80040 (interpolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.09904 - 1100.431/(237.274 + t/^{\circ}\text{C})$; temp range -28 to 32.5°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{mmHg}) = 6.9722 - 1099.4/(237.2 + t/^{\circ}\text{C})$; temp range -28 to 32°C (Antoine eq., Dean 1985, 1992)
 79860 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.10690 - 1104.29/(237.697 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 80060 (interpolated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.10046 - 1100.67/(-35.9 + T/\text{K})$; temp range 244 – 306 K (Antoine eq., Stephenson & Malanowski 1987)
 66190, 95740, 134520 (20 , 30 , 40°C , quoted from DIPPR, Tse et al. 1992)
 $\log(P/\text{mmHg}) = -16.5419 - 1.6655 \times 10^3/(T/\text{K}) + 13.923 \cdot \log(T/\text{K}) - 4.0958 \times 10^{-2} \cdot (T/\text{K}) + 2.9995 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 151 – 482 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 3729 (20°C , batch stripping, Mackay et al. 1979)
 3127* (24.3°C , equilibrium cell-concn ratio, measured range 2.5 – 26.1°C , Leighton & Calo 1981)
 $\ln(k_H/\text{atm}) = 23.12 - 4618/(T/\text{K})$; temp range 2.5 – 26.1°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 2649 (20°C , EPICS-GC, Linoff & Gossett 1983; Gossett 1985)
 2645 (24.8°C , EPICS-GC, measured range 10 – 34.6°C , Gossett 1987)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 8.845 - 3729/(T/\text{K})$; temp range 10.0 – 34.6°C (EPICS measurements, Gossett 1987)
 1520 (gas stripping-GC, Warner et al. 1987)
 7529 (20°C , EPICS-GC, Yurteri et al. 1987)
 2624* (EPICS-GC/FID, measured range 10 – 30°C , Ashworth et al. 1988)
 $\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 6.123 - 2907/(T/\text{K})$; temp range 10 – 30°C (EPICS measurements, Ashworth et al. 1988)
 19249 (20 – 25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 2316 (computed value, Yaws et al. 1991)
 2320, 3415, 4813 (20 , 30 , 40°C , infinite dilution activity coeff. γ -GC, Tse et al. 1992)
 2376 (20°C , selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 5.397 - 1586/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 2.13 (shake flask, Log P Database, Hansch & Leo 1987)
 2.13 (recommended, Sangster 1993)
 2.13 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

- 1.72 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.176 (calculated- K_{OW} , Kenaga & Goring 1980)
 1.813 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization: $t_{1/2}(\text{exptl}) \sim 22$ min at 25°C for volatilization of 1 mg/L in water in an open container of 65 -mm in depth stirring at 200 rpm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982)
 Evaporation $t_{1/2}(\text{exptl}) = 27.2$ min, $t_{1/2}(\text{calc}) = 0.029$ min, 20.1 min from water (Dilling 1977)
 $t_{1/2}(\text{calc}) = 5.9, 1.2$, and 4.7 d from a pond, river, and lake, respectively, using data for the oxygen reaeration rate of typical bodies of water (Mill et al. 1982; quoted, Howard 1989).

Photolysis:

- Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{O_3} = (3.7 \pm 1.0) \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Hull et al. 1973; quoted, Atkinson & Carter 1984)
 Photooxidation $t_{1/2} \sim 50$ min reaction with NO_2 under UV irradiation (Gay, Jr. et al. 1976)
 $k < 10^8 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $3.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)
 $k_{OH} \sim 4.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 2.9 d, loss of 29.2% in one day or 12 sunlit hour at 300 K in urban environments (Singh et al. 1981)
 $k \sim 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 1.5 mM *t*-BuOH as scavenger at pH 2 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983)
 $k_{O_3} = 3.7 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Tuazon et al. 1984)
 $k_{OH} = (14.9 \pm 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to *n*-butane at $22.3 \pm 1.2^\circ\text{C}$ with a lifetime of 0.75 d and $k_{OH} = 15.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to *n*-pentane at $24.4 \pm 0.4^\circ\text{C}$ (relative rate method, Edney et al 1986)
 photooxidation $t_{1/2} = 11$ h in relatively clean air or under 2 h in polluted air (Howard 1989)
 photooxidation $t_{1/2} = 9.9\text{--}98.7$ h, based on measured rate data for the vapor phase reaction with OH radical in air (Goodman et al. 1986; quoted, Howard et al. 1991)
 $k_{NO_3} = (6.60 \pm 3.10) \times 10^{-16} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ relative to ethene at 298 ± 2 K (relative rate method, Atkinson et al. 1987; quoted, Atkinson 1991)
 $k_{NO_3} = 6.6 \times 10^{-16} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ with a calculated atmospheric lifetime of 15 d, $k_{OH} = 8.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 3.4 d and $k_{O_3} = 3.7 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 12 yr at room temp. (Atkinson et al. 1987; quoted, Sabljic & Güsten 1990)
 $k_{OH}(\text{calc}) = 2.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 8.10 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1987)
 $k_{NO_3} = 1.28 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson et al. 1988; quoted, Sabljic & Güsten 1990)
 $k_{NO_3} = 1.23 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 2 K (Atkinson 1991)
 $k_{OH}(\text{calc}) = 2.04 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (as per Atkinson 1987 and 1988, Müller & Klein 1991)
 $k_{OH}(\text{calc}) = 2.67 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = 10.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (SAR [structure-activity relationship], Kwok & Atkinson 1995)

Hydrolysis: estimated acid-catalyzed rate constant $k = 1.4 \times 10^{-13} \text{ mol}^{-1} \text{ s}^{-1}$ at pH 5 with $t_{1/2}(\text{calc}) = 6 \times 10^{12}$ d at pH 5 (Wolfe 1980);

estimated $t_{1/2} \sim 2.0$ yr at pH 7.0 (Schmidt-Bleek et al. 1982; quoted, Howard 1989);

$t_{1/2} = 6\text{--}9$ months has been observed with no significant difference in hydrolysis rate between pH 4.5 and 8.5 (Cline & Delfino 1987; quoted, Howard 1989);

abiotic hydrolysis or dehydrohalogenation half-life of 12 months (Olsen & Davis 1990).

Biodegradation: aerobic $t_{1/2}(\text{aq.}) = 672\text{--}4320$ h, based on acclimated aerobic soil screening test data (Tabak et al. 1981; quoted, Howard et al. 1991); anaerobic $t_{1/2}(\text{aq.}) = 1944\text{--}4152$ h, based on anaerobic sediment grab sample data (Barrio-Lage et al. 1986; quoted, Howard 1989; Olsen & Davis 1990; Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 8.0$ wk, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 0.24\text{--}2.4$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

photodecomposition $t_{1/2} = 2.1$ h with NO under simulated atmospheric conditions (Dilling et al. 1976);

residence time of 2.9 d, loss of 29.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

photooxidation $t_{1/2} = 11$ h in relatively clean air (Edney et al. 1983; quoted, Howard 1989) or under 2 h in polluted air (Gay et al. 1976; quoted, Howard 1989);

lifetime of 0.75 d, based on measured rate data for the vapor phase reaction with OH radical in air at $(22.3 \pm 1.2)^\circ\text{C}$ (Edney et al. 1986);

$t_{1/2} = 9.9\text{--}98.7$ h, based on measured rate data for the vapor phase reaction with OH radical in air (Goodman et al. 1986; quoted, Howard et al. 1991);

atmospheric lifetimes: 15 d for the reaction with NO_3 radical for a 12-h nighttime average concn. of $2.4 \times 10^9 \text{ molecule cm}^{-3}$, 3.4 d for the reaction with OH radical for a 12-h average concentration

of 1.0×10^6 molecule cm^{-3} , and 12 yr for the reaction with O_3 for a 24-h average concentration of 7×10^{11} molecule cm^{-3} at room temp. (Atkinson et al. 1987).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on acclimated aerobic soil screening test data (Tabak et al. 1981; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}3168$ h, based on estimated aqueous aerobic biodegradation half-life and anaerobic grab sample data for soil from ground water aquifer receiving landfill leachate (Wilson et al. 1986; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on acclimated aerobic soil screening test data (Tabak et al. 1981; quoted, Howard et al. 1991);

$t_{1/2} < 10$ d (Ryan et al. 1988).

Biota: $t_{1/2} < 10$ d, subject to plant uptake via volatilization (Ryan et al. 1988).

5.1.1.28 *cis*-1,2-Dichloroethene

Common Name: *cis*-1,2-Dichloroethylene

Synonym: *cis*-acetylene dichloride, *cis*-1,2-dichloroethene, *cis*-1,2-dichloroethylene, (Z)-1,2-dichloroethene

Chemical Name: *cis*-1,2-dichloroethene, *cis*-1,2-dichloroethylene

CAS Registry No: 156-59-2

Molecular Formula: C₂H₂Cl₂, CHCl=CHCl

Molecular Weight: 96.943

Melting Point (°C):

−80.0 (Lide 2003)

Boiling Point (°C):

60.1 (Lide 2003)

Density (g/cm³ at 20°C):

1.2837 (Horvath 1982; Weast 1982–83; Riddick et al. 1986)

1.2818 (Dean 1985)

Molar Volume (cm³/mol):

75.52 (20°C, calculated-density)

86.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

31.57, 30.23 (25°C, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.205 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

3520 (Seidell 1940)

3500 (selected from literature or measured in DuPont laboratories, McGovern 1943)

5560 (37°C, shake flask-GC, Sato & Nakijima 1979)

3500 (summary of literature data, Horvath 1982)

7700 (Dean 1985)

6575, 6707, 6674 (20, 30, 40°C, infinite dilution activity coeff. γ[∞]-GC, Tse et al. 1992)

6608 (20°C, limiting activity coeff. γ[∞] by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

6410* (tentative values, measured range 10–40°C, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

S/(wt%) = 27.7353 − 0.178316·(T/K) + 2.93282 × 10^{−4}·(T/K)², temp range 283–313 K (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

25571* (23.74°C, temp range 0.76–83.63°C, Ketelaar et al. 1947)

27260* (interpolated-Antoine eq. regression, temp range −58.4 to 59°C, Stull 1947)

28984* (dynamic-ebulliometry, measured range 19.2–62°C, Flom et al. 1951)

23540 (calculated-Antoine eq., Weast 1972–73)

log (P/mmHg) = [−0.2185 × 7420.6/(T/K)] + 7.685137; temp range −58.4 to 260°C (Antoine eq., Weast 1972–73)

27010 (calculated-Antoine eq., Boublik et al. 1973)

log (P/mmHg) = 7.0233 − 1105.436/(230.62 + t/°C); temp range 0.76–83°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)

27010, 26740 (interpolated-Antoine equations; Boublik et al. 1984)

log (P/kPa) = 6.14603 − 1204.804/(230.55 + t/°C); temp range 0.76–83.63°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.03144 - 1153.738/(222.905 + t/^{\circ}\text{C})$; temp range 19.2–62°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 7.0223 - 1205.4/(230.6 + t/^{\circ}\text{C})$; temp range 0–84°C (Antoine eq., Dean 1985, 1992)
 26700 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.9771 - 1651.52/(T/\text{K})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 26980 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.30025 - 1293.95/(-32.41 + T/\text{K})$; temp range 273–334 K, (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.22178 - 1271.55/(-30.557 + T/\text{K})$; temp range 332–495 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 21710, 33305, 49350 (20, 30, 40°C, estimated, Tse et al. 1992)
 $\log (P/\text{mmHg}) = 55.9403 - 3.1677 \times 10^3/(T/\text{K}) - 18.572 \cdot \log (T/\text{K}) + 9.8828 \times 10^{-3} \cdot (T/\text{K}) + 5.7644 \times 10^{-14} \cdot (T/\text{K})^2$;
 temp range 193–527 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

342.2 (exptl.- $1/K_{AW} = C_W/C_A$, Hine & Mookerjee 1975;)
 1970, 2370 (calculated-group contribution, calculated-bond contribution; Hine & Mookerjee 1975)
 444 (20°C, EPICS-GC, Lincoff & Gossett 1983; Gossett 1985)
 413.4* (EPICS-GC, measured range 10.3–34.6°C, Gossett 1987)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 8.479 - 4192/(T/\text{K})$; temp range 10.3–34.6°C (EPICS measurements, Gossett 1987)
 441.1 (20°C, EPICS, Yurteri et al. 1987)
 460* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 5.164 - 3143/(T/\text{K})$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 745.5 (computed value, Yaws et al. 1991)
 324, 496, 740 (20, 30, 40°C, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)
 331, 518, 751 (20, 30, 40°C, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)
 319 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 674.5 (modified EPICS method-GC, Ryu & Park 1999)
 341 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 4.464 - 1559/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.86 (shake flask, Hansch & Leo 1985, 1987)
 1.86 (recommended, Sangster 1993)
 1.85 (infinite dilution activity coefficient-GC, Tse & Sandler 1994)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.56 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

1.176 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.69 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization: evaporation $t_{1/2} = 18$ min from dilute aqueous solution (Dilling 1975);
 Evaporation $t_{1/2}(\text{exptl}) = 19.4$ min, $t_{1/2}(\text{calc}) = 0.75$ min, 20.7 min from water (Dilling 1977);
 $t_{1/2} = 19.4$ min from a slowly stirred beaker 6.5 cm deep equivalent to $t_{1/2} = 5.0$ h in a body of water 1 m deep (Dilling 1977; quoted, Verschueren 1983; Howard 1990)
 $t_{1/2} = 3.1$ h was estimated from Henry's law constant for a model river 1 m deep with 1 m/s current and 3 m/s wind (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{O}_3} = 6.2 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Blume et al. 1976; quoted, Atkinson & Carter 1984; Tuazon et al. 1984)

$k_{\text{OH}} = 4.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 2.9 d, loss of 29.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{\text{O}_3} < 5.0 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Niki et al. 1983; quoted, Atkinson & Carter 1984; Tuazon et al. 1984; Atkinson et al. 1987)

$k_{\text{O}_3} = 3.7 \times 10^{-14} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, was estimated at 300 K (Lyman 1982)

$k < 800 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{O}_3} = 6.2 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Tuazon et al. 1984)

photooxidation $t_{1/2} = 286 \text{ h}$, based on estimated rate constant for the reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991)

$k_{\text{NO}_3} = (7.5 \pm 3.5) \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, relative to ethene at $298 \pm 2 \text{ K}$ (relative rate method, Atkinson et al. 1987; quoted, Atkinson 1991)

$k_{\text{NO}_3} = 7.5 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated atmospheric lifetime of 130 d, $k_{\text{OH}} = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 12 d, and $k_{\text{O}_3} < 5 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of > 9 yr at room temp. (Atkinson et al. 1987)

$k_{\text{OH}}(\text{calc}) = 2.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 2.38 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1987)

$k_{\text{NO}_3} = 1.46 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (relative rate method, Atkinson et al. 1988; quoted, Sabljic & Güsten 1990)

$k_{\text{OH}} = (2.38 \pm 0.14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (relative rate method, Tuazon et al. 1988)

$k_{\text{NO}_3} = (1.39 \pm 0.13) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = 2.24 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (as per Atkinson 1987 and 1988, Müller & Klein 1991)

$k_{\text{O}_3}(\text{aq.}) = (310 \pm 20) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2, with $t_{1/2} = 1.8 \text{ min}$ at pH 7 and 25°C (Yao & Haag 1991).

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic aqueous screening test data (Tabak et al. 1981; quoted, Howard et al. 1991); anaerobic $t_{1/2} = 2688\text{--}17280 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$t_{1/2} > 60 \text{ d}$ (Wood et al. 1985; quoted, Olsen & Davis 1990);

$k = 0.74 \text{ yr}^{-1}$ with $t_{1/2} = 88\text{--}339 \text{ d}$ (Barrio-Lage et al. 1986; quoted, Olsen & Davis 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

Photooxidation $t_{1/2} \sim 100 \text{ min}$ for reaction with NO_2 under UV irradiation, isomer not specified (Gay, Jr., et al. 1976)

photodecomposition $t_{1/2} = 3.0 \text{ h}$ with NO and 3.0 h with NO_2 under simulated atmospheric conditions (Dilling et al. 1976);

residence time of 2.9 d, loss of 29.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 129 \text{ d}$ resulting from the ozone attacking of the double bond (Tuazon et al. 1984; quoted, Howard 1990);

$t_{1/2} = 8.0 \text{ d}$ in the atmosphere for the reaction with photochemically produced OH radical (Goodman et al. 1986; quoted, Howard 1990);

$t_{1/2} = 286 \text{ h}$, based on estimated rate constant for the reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric lifetimes: 130 d for the reaction with NO_3 radical for a 12-h nighttime average concn. of $2.4 \times 10^9 \text{ molecule cm}^{-3}$, 12 d for the reaction with OH radical for a 12-h average concn. of $1.0 \times 10^6 \text{ molecule cm}^{-3}$, and > 9.0 yr for the reaction with O_3 for a 24-h average concn. of $7 \times 10^{11} \text{ molecule cm}^{-3}$, (Atkinson et al. 1987).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$k(\text{exptl}) = (310 \pm 20) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 25°C , with $t_{1/2} = 1.80$ min at pH 7 (Yao & Haag 1991).

Ground water: $1344\text{--}69000$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991) and an estimated half-life for anaerobic biodegradation from a ground water field studies of chlorinated ethylenes (Silka & Wallen 1988; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.1.29 *trans*-1,2-Dichloroethene

Common Name: *trans*-1,2-Dichloroethylene

Synonym: *trans*-1,2-dichloroethene, *trans*-1,2-dichloroethylene, *trans*-acetylene dichloride, Dioform, (E)-1,2-dichloroethene

Chemical Name: *trans*-1,2-dichloroethylene, *trans*-1,2-dichloroethene

CAS Registry No: 156-60-5

Molecular Formula: ClCH=CHCl

Molecular Weight: 96.943

Melting Point (°C):

−49.8 (Lide 2003)

Boiling Point (°C):

48.7 (Weast 1977, 1982–83)

Density (g/cm³ at 20°C):

1.2565 (Horvath 1982; Weast 1982–83)

Molar Volume (cm³/mol):

77.2 (20°C, calculated-density)

86.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

36.04, 28.89 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.98 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

6260 (Seidell 1940)

6300 (selected from literature of measured in DuPont laboratories, McGovern 1943; Dilling 1977)

6260 (recommended, Horvath 1982)

4480, 4480, 4333 (20, 30, 40°C, infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)

4488, 4111, 3931 (20, 30, 40°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)

$\log (P/\text{kPa}) = 6.09105 - 1142.553/(231.998 + t/^{\circ}\text{C})$; temp range -38.2 to 84.84°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 6.04724 - 1112.321/(227.56 + t/^{\circ}\text{C})$; temp range -0.68 to 46.7°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 6.9651 - 1141.9/(231.9 + t/^{\circ}\text{C})$; temp range -38.2 to 85°C (Antoine eq., Dean 1985, 1992)
 45300 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.68147 - 1498.42/(T/\text{K})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 44400 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 5.93307 - 1059.93/(-50.83 + T/\text{K})$; temp range 263 – 323 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.27465 - 1226.69/(-33.653 + T/\text{K})$; temp range 321 – 473 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 36250, 53970, 78100 (20, 30, 40°C , quoted from DIPPR, Tse et al. 1992)
 $\log (P/\text{mmHg}) = 48.4574 - 3.0496 \times 10^3/(T/\text{K}) - 14.694 \cdot \log (T/\text{K}) - 2.1262 \times 10^{-9} \cdot (T/\text{K}) + 7.3465 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 223 – 508 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

682.7 (calculated as $1/K_{\text{AW}}$, $C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)
 1970, 2370 (calculated-group contribution, calculated-bond contribution; Hine & Mookerjee 1975)
 669 (calculated-P/C, Dilling 1977)
 669 (calculated-P/C, Mackay & Shiu 1981)
 950.5 (20°C , EPICS, Lincoff & Gossett 1983; Gossett 1985)
 950* (EPICS-GC/FID, measured range 10 – 34.6°C , Gossett 1987)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 9.341 - 4182/(T/\text{K})$; temp range 10.0 – 34.6°C (EPICS measurements, Gossett 1987)
 914 (20°C , EPICS-GC, Yurteri et al. 1987)
 539 (gas stripping-GC, Warner et al. 1987)
 958* (EPICS-GC/FID, measured range 10 – 30°C , Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 5.333 - 2964/(T/\text{K})$; temp range 10 – 30°C (EPICS measurements, Ashworth et al. 1988)
 729 (20 – 25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 676 (computed value, Yaws et al. 1991)
 800, 1196, 1793 (20, 30, 40°C , infinite dilution activity coeff. γ -GC, Tse et al. 1992)
 768.7* (20°C , activity coeff. γ^{∞} -differential pressure transducer, measured range 20 – 40°C , Wright et al. 1992)
 1023* (26.2°C , EPICS-GC, measured range 26.2 – 46.1°C , Hansen et al. 1993)
 773 (20°C , equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 634.8 (modified EPICS method-GC, Ryu & Park 1999)
 875 (20°C , selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{\text{AW}} = 5.247 - 1669/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.06 (Hansch & Leo 1985)
 2.09 (shake flask, Log P Database, Hansch & Leo 1987; recommended, Hansch et al. 1995)
 2.09 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

1.34 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)
 1.68 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

1.56 (calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)
 1.77 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization: experimental $t_{1/2}(\text{exptl}) = 24$ min for 1 mg/L from water when stirred at 200 rpm at approximately 25°C in an open container of depth 65 mm (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982);

Evaporation $t_{1/2}(\text{exptl}) = 24$ min, $t_{1/2}(\text{calc}) = 0.85$ min, 20.8 min from water (Dilling 1977)

Volatilization $t_{1/2} = 3.0$ h from a model river 1 m deep with 1 m/s current and a 3 m/s wind (Lyman et al. 1982; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{O}_3} = 3.8 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (Blume et al. 1976; quoted, Atkinson & Carter 1984)

$k_{\text{OH}} = 4.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 2.9 d, loss of 29.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k_{\text{O}_3} = (1.8 \pm 0.29) \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Zhang et al. 1983)

$k_{\text{O}_3} = 1.2 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Niki et al. 1983; quoted, Atkinson & Carter 1984; Tuazon et al. 1984)

$k_{\text{O}_3} = 2.0 \times 10^{-23} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 298–323 K (quoted, Atkinson & Carter 1984)

$k_{\text{O}_3} = 2.3 \times 10^5 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, estimated at 300 K (Lyman 1982)

$k < 10^5 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $6.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radicals at 25°C (Mabey et al. 1982)

$k = (5.7 \pm 1.0) \times 10^3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 1 mM *t*-BuOH as scavenger at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{O}_3} = 1.8 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Tuazon et al. 1984)

$k_{\text{OH}} = 1.79 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1986; quoted, Atkinson et al. 1987; Sabljic & Güsten 1990)

$k_{\text{NO}_3} = (5.7 \pm 2.7)5 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 ± 2 K (relative rate method, Atkinson et al. 1987)

$k_{\text{NO}_3} = 5.7 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated atmospheric lifetime of 179 d, $k_{\text{OH}} = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 5.1 d and $k_{\text{O}_3} = 1.5 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a lifetime of 110 d at room temp. (Atkinson et al. 1987)

$k_{\text{OH}}(\text{calc}) = 2.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1987)

photooxidation $t_{1/2} = 25.2$ h, based on estimated rate constant for the reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991)

$k_{\text{NO}_3} = 1.11 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson et al. 1988; quoted, Sabljic & Güsten 1990)

$k_{\text{NO}_3} = (1.07 \pm 0.11) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ relative to ethene at 298 ± 2 K (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = 2.57 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (as per Atkinson 1987 and 1988, Müller & Klein 1991)

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 672$ –4320 h, based on unacclimated aerobic aqueous screening test data (Tabak et al. 1981; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688$ –17280 h, based on estimated unacclimated aqueous aerobic degradation half-life (Howard et al. 1991);

$k = 0.1 \text{ yr}^{-1}$ with $t_{1/2} = 53$ d (Wood et al. 1985; quoted, Olsen & Davis 1990);

rate constant $k = 0.12$ –0.35 mini^{-1} in a fixed-film, packed-bed bioreactor containing a consortium of microorganisms (Strandberg et al. 1989);

$k = 1.8 \text{ yr}^{-1}$ with $t_{1/2} = 132$ –147 d (Barrio-Lage et al. 1986; quoted, Olsen & Davis 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 0.24$ –2.4 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

photodecomposition $t_{1/2} = 2.9$ h with NO and $t_{1/2} = 2.8$ h with NO_2 under simulated atmospheric conditions (Dilling et al. 1976);

Photooxidation $t_{1/2} \sim 100$ min for reaction with NO_2 under UV irradiation, isomer not specified (Gay, Jr., et al. 1976)

residence time of 2.9 d, loss of 29.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 44$ d resulting from ozone attacking of the double bond (Tuazon et al. 1984; quoted, Howard 1990);

$t_{1/2} = 3.6$ d in the atmosphere for the reaction with photochemically produced OH radical (Goodman et al. 1986; quoted, Howard 1990);

$t_{1/2} = 25.2$ h, based on estimated rate constant for reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991);

atmospheric lifetimes, $\tau = 170$ d for the reaction with NO_3 radical for a 12-h nighttime average concn. of 2.4×10^9 molecule cm^{-3} , $\tau = 5.1$ d for the reaction with OH radical for a 12-h average concn. of 1.0×10^6 molecule $\cdot \text{cm}^{-3}$, and $\tau = 110$ d for the reaction with O_3 for a 24-h average concentration of 7×10^{11} molecule $\cdot \text{cm}^{-3}$ (Atkinson et al. 1987).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on unacclimated aerobic aqueous screening test data (Tabak et al. 1981; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}69000$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life and estimated half-life for anaerobic biodegradation of chlorinated ethylenes from a ground water field study (Silka & Wallen 1988; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on unacclimated aerobic aqueous screening test data (Tabak et al. 1981; quoted, Howard et al. 1991);

$t_{1/2} < 10$ d (Ryan et al. 1988).

Biota: $t_{1/2} < 10$ d, subject to plant uptake via volatilization (Ryan et al. 1988).

5.1.1.30 Trichloroethylene

Common Name: Trichloroethylene

Synonym: TCE, acetylene trichloride, ethylene trichloride

Chemical Name: 1,1,2-trichloroethylene

CAS Registry No: 79-01-6

Molecular Formula: C_2HCl_3 , $CHCl=CCl_2$

Molecular Weight: 131.388

Melting Point ($^{\circ}C$):

-84.7 (Lide 2003)

Boiling Point ($^{\circ}C$):

87.21 (Lide 2003)

Density (gm/cm^3 at $20^{\circ}C$):

1.4642 (Dreisbach 1959; Horvath 1982; Weast 1982-83)

1.4554 ($25^{\circ}C$, Dreisbach 1959)

Molar Volume (cm^3/mol):

89.02 (calculated-density, Miller et al. 1985)

107.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

34.27, 31.47 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0 (Suntio et al. 1988)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1818 (volumetric method, Wright & Schaffer 1932;)

1100 (data presented in graph, temp range $0-80^{\circ}C$, McGovern 1943)

1288* (temp range $10-50^{\circ}C$, Vallaud et al. 1957)

1100 ($20^{\circ}C$, McConnell et al. 1975; Pearson & McConnell 1975)

1780, 1500, 1470 (3, 20, $34^{\circ}C$, shake flask-GC/ECD, Chiou & Freed 1977)

1000, 1100, 1100 (1.5, 20, $25^{\circ}C$, literature average, Dilling 1977)

1000 (shake flask-titration/turbidity, Coca et al. 1980)

1472 (shake flask-LSC, Banerjee et al. 1980)

1474 (shake flask-LSC, Veith et al. 1980)

1100* (summary of literature data, temp range $0-80^{\circ}C$, Horvath 1982)

1366 (generator column-HPLC, Tewari et al. 1982)

743.1 ($30^{\circ}C$, headspace-GC, McNally & Grob 1984)

1370 (selected, Riddick et al. 1986)

1421 ($23-24^{\circ}C$, shake flask-GC, Broholm et al. 1992)

1350 ($20^{\circ}C$, calculated-activity coefficients, Wright et al. 1992)

1483, 1450, 1468 (20, 30, $40^{\circ}C$, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

1349, 1409, 1308 (20, 30, $40^{\circ}C$, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

1300-1500 ($9-71^{\circ}C$, generator column-GC, data presented in graph, Heron et al. 1998)

1330 ($20^{\circ}C$, limiting activity coeff. γ^{∞} by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

1280* (recommended, temp range $0-60^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(wt\%) = 1.4049 - 8.2223 \times 10^{-3} \cdot (T/K) + 1.3218 \times 10^{-5} \cdot (T/K)^2$, temp range 273-333 K (equation derived from literature solubility data, Horvath & Getzen 1999a)

1417* ($21^{\circ}C$, batch equilibrium-GC, sample prepared at 1.0 MPa, measure range $21-117^{\circ}C$, Knauss et al. 2000)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 19733* (temp range 25–87.15°C, Hertz & Rathmann 1912)
 9331 (extrapolated, data presented in graph, McGovern 1943)
 9645* (25.5°C, ebulliometry, measured range 18–86°C, McDonald 1944)
 $\log (P/\text{cmHg}) = 30.482609 - 2936.227/(T/K) - 7.999975 \cdot \log (T/K)$; temp range 18–86°C (ebulliometry, McDonald 1944)
 9735* (interpolated-Antoine eq. regression, temp range 25–87.2°C, Stull 1947)
 9906 (calculated-Antoine eq., Dreisbach 1959; quoted, Hine & Mookerjee 1975)
 $\log (P/\text{mmHg}) = 7.02808 - 1315.0/(230.0 + t/^{\circ}\text{C})$; temp range 7–155°C (Antoine eq. for liquid state, Dreisbach 1959)
 9723 (calculated-Antoine eq., Weast 1972–73)
 $\log (P/\text{mmHg}) = [-0.2185 \times 8314.7/(T/K)] + 7.956342$; temp range –43.8 to 86.7°C (Antoine eq., Weast 1972–73)
 9224 (calculated-Antoine eq., Boublik et al. 1973)
 $\log (P/\text{mmHg}) = 6.51827 - 1018.603/(192.731 + t/^{\circ}\text{C})$; temp range 17–86°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 8000 (20°C, Perry & Chilton 1973)
 7700 (20°C, McConnell et al. 1975; Pearson & McConnell 1975)
 3066, 7866, 9866 (1.5, 20, 25°C, interpolated from literature data, Dilling 1977)
 7998, 12660 (20°C, 30°C, Verschuereen 1983; Hewitt et al. 1992)
 9200, 9690 (interpolated-Antoine equations., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 5.59553 - 994.46/(189.705 + t/^{\circ}\text{C})$; temp range 17.8–86.5°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{kPa}) = 4.70615 - 614.104/(140.089 + t/^{\circ}\text{C})$; temp range 25–87.5°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 6.5183 - 1018.6/(192.7 + t/^{\circ}\text{C})$; temp range 18–86°C (Antoine eq., Dean 1985, 1992)
 6307 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.15298 - 1315.04/(230.0 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 9911 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.15298 - 1315.0/(-43.15 + T/K)$; temp range 280–428 K (Antoine eq., Stephenson & Malanowski 1987)
 9691 (resistance measurement-Antoine eq., Foco et al. 1992)
 7753, 12350, 19080 (20, 30, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log (P/\text{mmHg}) = 23.6735 - 2.3763 \times 10^3/(T/K) - 5.8275 \cdot \log (T/K) + 1.9586 \times 10^{-3} \cdot (T/K) + 2.8882 \times 10^{-14} \cdot (T/K)^2$; temp range 188–571 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 1186 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)
 248, 1186 (calculated-group contribution method, calculated-bond contribution, Hine & Mookerjee 1975)
 967 (calculated-P/C, Neely 1976)
 388.2, 1215 (1.5, 25°C, calculated-P/C, Dilling 1977)
 890, 975 (20°C, exptl., calculated-P/C, Dilling 1977)
 1103 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)
 $\log (H/\text{atm}) = 8.59 - 1716.16/(T/K)$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)
 985 (20°C, batch stripping-GC, Mackay et al. 1979)
 985* (25.2°C, equilibrium cell-concn ratio-GC/FID, measured range 1–26.1°C, Leighton & Calo 1981)
 $\ln (k_H/\text{atm}) = 21.89 - 4647/(T/K)$; temp range 1.0–26.1°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 999 (20°C, batch stripping-GC, Munz & Roberts 1987)
 970 (20°C, EPICS-GC, Lincoff & Gossett 1983; Gossett 1985)
 774; 683 (20°C, EPICS-GC; batch air stripping-GC, measured range 10–30°C, Lincoff & Gossett 1984)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 11.94 - 4929/(T/K)$; temp range 10–30°C (EPICS measurements, Lincoff & Gossett 1984)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 9.703 - 4308/(T/K)$; temp range 10–30°C (batch air stripping measurements, Lincoff & Gossett 1984)

- 452, 795, 1348 (10, 20, 30°C, multiple equilibrium technique-GC, Munz 1985)
- 1185 (adsorption isotherm, Urano & Murata 1985)
- 970.7* (24.8°C, EPICS-GC, measured range 9.6–34.6°C, Gossett 1987)
- $\ln [H/(\text{atm m}^3/\text{mol})] = 11.37 - 4780/(T/K)$; temp range 9.6–34.6°C (EPICS-GC, Gossett 1987)
- 816 (20°C, EPICS-GC, Munz & Roberts 1987)
- $\log K_{AW} = 6.026 - 1909/(T/K)$; temp range 10–30°C (EPICS-GC measurements, Munz & Roberts 1987)
- 1185 (gas stripping-P/C, Warner et al. 1987)
- 1048 (20°C, EPICS, Yurteri et al. 1987)
- 1034* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
- $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 7.845 - 3702/(T/K)$; temp range 10–30°C (EPICS-GC, Ashworth et al. 1988)
- 922 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
- 768.4 (purge and trap method, Tancredi & Yanagisawa 1990)
- 768* (tap water, EPICS-GC, measured range 25–47.2°C, Tancredi & Yanagisawa 1990)
- $\log K_{AW} = 6.664 - 2141/(T/K)$; temp range 25–47.2°C (EPICS-GC, Tancredi & Yanagisawa 1990)
- 1182 (computed value, Yaws et al. 1991)
- 709, 1155, 1753 (20, 30, 40°C, determined from measured infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)
- 756, 1152, 1908 (20, 30, 40°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
- 996 (activity coefficient γ^∞ from gas stripping-GC, Li et al. 1993)
- 1043* (static headspace-GC, measured range 25–50°C, Robbins et al. 1993)
- 794 (23°C, batch air stripping-IR, Nielsen et al. 1994)
- 870* (EPICS-GC/FID, measured range 2–25°C, Dewulf et al. 1995)
- 381, 1073 (6.0, 25°C, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
- $\ln K_{AW} = -3648/(T/K) + 0.00813 \cdot Z + 11.121$; with Z salinity 0–35.5‰, temp range 2–35°C (EPICS-GC/FID, Dewulf et al. 1995)
- 775 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
- 1180 (vapor-liquid equilibrium-GC, Turner et al. 1996)
- $K_{AW} = 0.151 - 0.00597 \cdot (T/K) + 0.000680 \cdot (T/K)^2$; temp range 0–45°C (vapor-liquid equilibrium-GC measurements with additional lit. data, Turner et al. 1996)
- 751 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
- 885* (headspace equilibrium-GC, measured range 15–45°C, Peng & Wan 1997)
- $\ln (k_H/\text{atm}) = 8.19 - 1642/(T/K)$; temp range 15–45°C (headspace-GC measurements, Peng & Wan 1997)
- 709* (20°C, headspace equilibrium-GC, Peng & Wan 1998)
- 1195 (sea water 36‰, headspace-GC, measured range 15–45°C, Peng & Wan 1998)
- $\log (k_H/\text{atm}) = 8.62 - 1736/(T/K)$; sea water 36‰ NaCl, temp range: 15–45°C (headspace-GC measurements, Peng & Wan 1998)
- 1055 (modified EPICS method-GC, Ryu & Park 1999)
- $\ln [H/(\text{atm m}^3/\text{mol})] = 7.99 - 3736/(T/K)$; temp range 10–95°C (EPICS measurements, Heron et al. 1998)
- 1006; 981; 352 (EPICS-GC; quoted lit.; calculated-P/C, David et al. 2000)
- 703.4* (calculated from P and exptl measured solubility, temp range 21–117°C, Knauss et al. 2000)
- 823* (solid-phase microextraction-GC, measured range 15–40°C, Bierwagen & Keller 2001)
- $\ln K_{AW} = 9.9697 - 3287.5/(T/K)$; measured range 15–4 0°C (SPME-GC, Bierwagen & Keller 2001)
- 765 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)
- $\log K_{AW} = 5.874 - 1871/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)
- 995* (EPICS-SPME, measured range 2–60°C, Görgényi et al. 2002)
- $\ln K_{AW} = 12.13 - 3908.2/(T/K)$; temp range 2–60°C (EPICS-SPME method, Görgényi et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated

* are compiled at the end of this section:

- 2.37 (Hansch & Elkins 1971)
- 2.29 (Leo et al. 1971; Hansch & Leo 1979; 1987)
- 2.61 (shake flask-GC/ECD, Chiou & Freed 1977)
- 2.42 (shake flask-LSC, Banerjee et al. 1980)
- 2.42 (shake flask-LSC, Veith et al. 1980; Veith & Kosian 1982; Veith et al. 1983)
- 2.86 (HPLC- k' correlation, McDuffie 1981)

- 2.53 (generator column-HPLC, Tewari et al. 1982)
- 2.71, 2.79, 3.49, 3.57 (values used for OECD Lab. comparison tests, Harnisch et al. 1983)
- 2.84 (HPLC-RT correlation, Eadsforth 1986)
- 2.42 (recommended, Sangster 1993)
- 2.67 (calculated-activity coefficients γ° , Tse & Sandler 1994)
- 2.61 (recommended, Hansch et al. 1995)
- 2.27* (24.8°C, EPICS-GC, measured range 2.2–24.8°C, Dewulf et al. 1999)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C:

- 2.99 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, log BCF:

- 1.59 (rainbow trout, Neely et al. 1974)
- 1.23–1.36 (calculated- K_{OW} , Veith et al. 1979; Veith et al. 1980)
- 1.23 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1982)
- 1.23–1.59 (bluegill sunfish & rainbow trout, Barrows et al. 1980; Lyman 1981)
- 1.59 (rainbow trout, quoted, Bysshe 1982)
- 1.987 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
- 1.20 (calculated-MCI χ , Koch 1983)
- 2.996 (activated sludge, Freitag et al. 1984)
- 3.06, 2.39 (*Chlorella fusca*, calculated- K_{OW} , Geyer et al. 1984)
- 1.20, 1.05 (quoted, calculated, Sabljic 1987)
- 1.025 (quoted from USEPA 1986, Yeh & Kastenbergh 1991)
- 1.420 (calculated- K_{OW} , McCarty et al. 1992)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

- 2.10 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
- 2.20 (Pavlou & Weston 1983, 1984)
- 1.76, 2.20 (ICN humic acid-coated Al_2O_3 , ICN humic acid, Garbarini & Lion 1985)
- 1.66; 2.14, 2.40 (predicted-S, predicted- K_{OW} , Garbarini & Lion 1985)
- 1.76; 0.616 (Sapsucker Woods humic acid, Sapsucker Woods fulvic acid, Garbarini & Lion 1986)
- 1.238, 2.079, 2.045, 0.30, 1.827 (tannic acid, lignin, zein, cellulose, Aldrich humic acid, Garbarini & Lion 1986)
- 2.025, 2.086 (Sapsucker Woods soil, Sapsucker Woods ether-extracted soil, Garbarini & Lion 1986)
- 2.161, 2.458 (humic, oxidized humic, Garbarini & Lion 1986)
- 2.663 (fats, waxes, resins, Garbarini & Lion 1986)
- 2.54, 1.72 (Lula aquifer 0.032% OC, Apalachee soil 1.4% OC, batch equilibrium-sorption isotherm, Stauffer & MacIntyre 1986)
- 2.00; 1.84 (quoted from Seip et al. 1986, calculated-MCI χ , Bahnick & Doucette 1988)
- 2.03 (soil, Chiou et al. 1988; quoted, Grathwohl 1990)
- 2.02, 2.11 (soil: quoted, HPLC-RT correlation, Hodson & Williams 1988)
- 1.79 (20°C, humic acid, Peterson et al. 1988; quoted, Grathwohl 1990)
- 1.53 (untreated Marlette soil A horizon, organic carbon OC 2.59%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.61, 2.12 (organic cations treated Marlette soil A horizon: HDTMA treated OC 6.48%; DDTMA treated, OC 4.37%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.89, 2.50, 2.25 (organic cations treated Marlette soil B_t horizon: HDTMA treated OC 3.72%, DDTMA treated OC 1.98%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.09; 2.56; 3.43 (20°C, soil, sand and loess; weathered shale and mudrock; unweathered shale and mudrock, sorption isotherm-headspace method, Grathwohl 1990)
- 1.97, 2.15 (20°C, calculated- K_{OW} , Grathwohl 1990)
- 0.30–3.64 (cellulose anthracite, quoted, Grathwohl 1990)
- 2.01 (calculated average, Olsen & Davis 1990)
- 2.20, 1.78 (humic acid, humic acid-coated Al_2O_3 , Pavlostathis & Jaglal 1991)
- 2.03 (surface soil, Pavlostathis & Jaglal 1991)

- 3.39, 2.00 (organic carbon soil, Doust & Huang 1992)
 1.60, 1.60, 2.15 (bentonite, green & tan clay, Doust & Huang 1992)
 0.35, 1.40, 1.90, 2.20 (Barnwell, Congaree, McBean I & II sands, Doust & Huang 1992)
 1.66, 2.64, 2.83 (calculated-equilibrium desorption data, Pavlostathis & Mathavan 1992)
 2.23, 2.33, 2.35, 2.34, 2.34, 2.36, 2.41 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, Belgium, organic carbon $f_{OC} = 4.12\%$, EPICS-GC/FID, Dewulf et al. 1999)
 2.80; 2.00 (soil, calculated-universal solvation model; quoted exptl., Winget et al. 2000)
 1.92, 2.00, 1.75 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, average, Delle Site 2001)

Sorption Partition Coefficient, log K_{OM} :

- 1.23 (untreated Marlette soil A horizon, organic matter OM 5.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 2.42, 1.89 (organic cations treated Marlette soil A horizon: HDTMA treated, organic matter 10.03%; DDTMA treated, OM 5.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 2.78, 2.36 (organic cations treated Marlette soil B_t horizon: HDTMA treated OM 4.85%, DDTMA treated OM 2.73%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 2.56, 2.53 (organic cations HDTMA treated soils: St. Clair soil B_t horizon OM 4.38%; Oshtemo soil B_t horizon OM 1.12%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 1.74 (Florida peat, OC 57.1%, batch equilibrium-sorption isotherm, Rutherford & Chiou 1992)

Environment Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization: evaporation $t_{1/2}$ (exptl.) = 21 min, calculated $t_{1/2}$ (calc) = 0.48 min from dilute aqueous solution of 1 ppm initial concn. in a 250 mL beaker with constant stirring at room temp (Dilling et al. 1975); volatilization $k = 2.79, 5.07 \text{ g cm}^{-2} \text{ s}^{-1}$ at $23.7 \pm 0.5^\circ\text{C}$ into the atmosphere (Chiou & Freed 1977); Evaporation $t_{1/2}$ (exptl) = 17.7, 18.5, 23.5 min, $t_{1/2}$ (calc) = : 0.47 min, 23.8 min at $20\text{--}25^\circ\text{C}$ and $t_{1/2}$ (exptl) = 31.9 min at 1.5°C from water (Dilling 1977)
 ratio of evaporation rate constant to that of oxygen reaeration rate constant: measured as 0.49 as compared to the predicted 0.44 (Smith et al. 1980);
 $t_{1/2}$ (exptl) = $1.42 \times 10^4 \text{ s}$ and $t_{1/2}$ (calc) = $5.1 \times 10^3 \text{ s}$ for water body of depth of 22.5 m (Klöpffer et al. 1982)
 estimated $t_{1/2} = 3.4 \text{ h}$ from water (Thomas 1982);
 $k = 0.025 \text{ d}^{-1}$, $t_{1/2} = 28 \text{ d}$ in spring at $8\text{--}16^\circ\text{C}$, $k = 0.052 \text{ d}^{-1}$, $t_{1/2} = 13 \text{ d}$ in summer at $20\text{--}22^\circ\text{C}$, $k = 0.045 \text{ d}^{-1}$, $t_{1/2} = 15 \text{ d}$ in winter at $3\text{--}7^\circ\text{C}$ for the periods when volatilization appears to dominate, and $k = 0.064 \text{ d}^{-1}$, $t_{1/2} = 10.7 \text{ d}$ with HgCl_2 , and $k = 0.081 \text{ d}^{-1}$, $t_{1/2} = 9.6 \text{ d}$ without HgCl_2 in September 9–15, in marine mesocosm experiments (Wakeham et al. 1983);
 $k = 7.22 \times 10^{-3} \text{ h}^{-1}$ (Mackay et al. 1985).

Photolysis: $t_{1/2} = 3.5 \text{ h}$ estimated from lab. simulated UV photolysis (light intensity about 6 times of natural sunlight at noon on a summer day in Freeport) for 10 ppm to react with 5 ppm NO at $27 \pm 1^\circ\text{C}$ (Dilling et al. 1976); probably would not occur (Callahan et al., 1979)
 photocatalyzed mineralization by the presence of TiO_2 with the rate of $830 \text{ ppm min}^{-1} \cdot \text{g}^{-1}$ of catalyst (Ollis 1985);
 $k = (4.08\text{--}6.27) \times 10^{-3} \text{ h}^{-1}$ with H_2O_2 under photolysis at 25°C in F-113 solution and with HO- in the gas (Dilling et al. 1988).

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

- $k_{OH} = 2.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow system-LMR, Howard 1976)
 Photooxidation $t_{1/2} \sim 120 \text{ min}$ for reaction with NO_2 under UV irradiation (Gay, Jr. et al 1976)
 $k_{OH}^* = (2.37 \pm 0.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 234–420 K (discharge flow-resonance fluorescence, Chang & Kaufman 1977)
 $k_{OH} = (0.27 \pm 0.08) \times 10^{10} \text{ cm}^3 \text{ M}^{-1} \text{ s}^{-1}$ at 1 atm and $305 \pm 2 \text{ K}$ (relative rate method, Winer et al. 1978)
 $k_{OH} = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson et al. 1979,1982; quoted, Tuazon et al. 1984; Atkinson et al. 1987)
 $k_{OH} = 2.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 5.3 d, loss of 17.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)
 $k_{OH} = 1.2 \times 10^{12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ estimated, and $k_{O_3} = 3.6 \times 10^3 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (Lyman 1982)

$k_{O_3} < 3 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reaction with ozone at $296 \pm 2 \text{ K}$ (Atkinson et al. 1982; quoted, Atkinson & Carter 1984; Tuazon et al. 1984; Atkinson et al. 1987)

$k < 1000 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen, $k = 6.0 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 radical (Mabey et al. 1982)

$k = (17 \pm 4) \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water at pH 2 and $20\text{--}23^\circ\text{C}$ (Hoigné & Bader 1983)

$k_{O_3} < 3 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH} = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Tuazon et al. 1984)

$k_{OH}(\text{calc}) = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1985)

$k_{OH} = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.10 d^{-1} , $k_{O_3} < 3 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.002 d^{-1} at room temp. (Atkinson et al. 1985)

$k_{OH} = (2.86 \pm 0.40) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to *n*-butane at $23.2 \pm 1.1^\circ\text{C}$ and a calculated atmospheric lifetime $\tau = 4.0 \text{ d}$ (Edney et al. 1986)

$k_{NO_3} = (1.5 \pm 0.7) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (relative rate method, Atkinson et al. 1987)

$k_{NO_3} = 1.5 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated atmospheric lifetime $\tau = 64 \text{ d}$, $k_{OH} = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with lifetime $\tau = 9.6 \text{ d}$ and $k_{O_3} < 3 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with lifetime $\tau > 1.5 \text{ yr}$ at room temp. (Atkinson et al. 1987)

$k_{OH}(\text{calc}) = 0.70 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 2.36 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1987)

$k_{OH}^* = 2.36 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH}(\text{calc}) = 6.92 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (as per Atkinson 1987 and 1988, Müller & Klein 1991)

$k_{NO_3} = (2.81 \pm 0.17) \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ relative to ethene at $298 \pm 2 \text{ K}$ (Atkinson 1991)

$k(\text{aq.}) = (15 \pm 2) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and $21 \pm 1^\circ\text{C}$, with a half-life of 37 min at pH 7 (Yao & Haag 1991).

Hydrolysis: not an important process (Mabey et al. 1982);

$k = 0.065 \text{ month}^{-1}$ at 25°C with $t_{1/2} = 10.7 \text{ months}$ (Dilling et al. 1975; quoted, Howard et al. 1991);

$k = 9.0 \times 10^{-5} \text{ h}^{-1}$ (Mackay et al. 1985);

abiotic hydrolysis or dehydrohalogenation $t_{1/2} = 10.7 \text{ months}$ (Olsen & Davis 1990)

$t_{1/2} = 320 \text{ d}$ at pH 7 in natural waters (Capel & Larson 1995)

Biodegradation: can be biodegraded by microorganisms in sea water;

$t_{1/2}(\text{aerobic}) = 6 \text{ months to } 1 \text{ yr}$ based on acclimated soil screening test data (Tabak et al. 1981; quoted, Howard et al. 1991)

$k = 1.1 \text{ yr}^{-1}$ with $t_{1/2} = 230 \text{ d}$ (Roberts et al. 1982; quoted, Olsen & Davis 1990)

$t_{1/2}(\text{anaerobic}) = 98 \text{ d to } 4.5 \text{ yr}$, based on sediment grab sample data (Barrio-Lage et al. 1986; quoted, Howard et al. 1991);

$k = 0.06 \text{ yr}^{-1}$ with biodegradation $t_{1/2} = 33 \text{ d}$, microcosm constructed with crushed rock and water containing low microbial biomass depleted all TCE in 21 months of incubation (Barrio-Lage et al. 1987, quoted, Olsen & Davis 1990)

$k \sim 0.02 \text{ min}^{-1}$ in a fixed-film, packed-bed bioreactor containing a consortium of microorganisms (Strandberg et al. 1989);

$k = 0.08 \text{ yr}^{-1}$ with $t_{1/2} = 43 \text{ d}$ (Olsen & Davis 1990)

$t_{1/2}(\text{aerobic}) = 180 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 98 \text{ d}$ in natural waters (Capel & Larson 1995)

Biotransformation: estimated rate constant of $1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 10.5 \text{ h}^{-1}$ (flagfish, calculated-BCF $\times k_2$, McCarty et al. 1992)

$k_2 = 0.398 \text{ h}^{-1}$ (flagfish, estimated-one compartment first-order kinetics, McCarty et al. 1992)

Environmental Half-Lives:

Air: tropospheric $t_{1/2} = 6.0 \text{ wk}$, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

photodecomposition $t_{1/2}$ = of 3.5 h with NO and $t_{1/2} = 2.9 \text{ h}$ with NO_2 under simulated atmospheric conditions (Dilling et al. 1976);

photooxidation $t_{1/2} \sim 120 \text{ min}$ for reaction with NO_2 under UV irradiation (Gay, Jr. et al. 1976)

residence time of 5.3 d , loss of 17.2% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 27\text{--}272$ h, based on photooxidation half-life in air (Atkinson 1985; quoted, Howard et al. 1991);
atmospheric lifetime $\tau = 4.0$ d, based on the photooxidation rate constant in the gas phase at $23.2 \pm 1.1^\circ\text{C}$ (Edney et al. 1986);

atmospheric lifetimes $\tau = 64$ d for the reaction with NO_3 for a 12-h nighttime average concn. of 2.4×10^9 molecule/ cm^3 , $\tau = 9.6$ d for the reaction with OH radical for a 12-h average concn. of 1.0×10^6 molecule cm^{-3} , and $\tau > 1.5$ yr for the reaction with O_3 for a 24-h average concn. of 7×10^{11} molecule/ cm^3 (Atkinson et al. 1987);

$t_{1/2} \sim 3.7$ d (Yeh & Kastenberg 1991).

Surface water: estimated $t_{1/2} = 1.2\text{--}90$ d in surface waters at various locations in the Netherlands in case of a first order reduction process (Zoeteman et al. 1980)

half-lives from marine mesocosm: $t_{1/2} = 28$ d in the spring at $8\text{--}16^\circ\text{C}$, $t_{1/2} = 13$ d in the summer at $20\text{--}22^\circ\text{C}$ and $t_{1/2} = 15$ d in the winter at $3\text{--}7^\circ\text{C}$ when volatilization dominates, and $t_{1/2} = 10.7$ d and 8.6 d for experiments with and without HgCl_2 as poison, respectively, in September 9–15 (Wakeham et al. 1983)

Biodegradation $t_{1/2}$ (aerobic) = 100 d, $t_{1/2}$ (anaerobic) = 400 d; hydrolysis $t_{1/2} = 320$ d at pH 7 in natural waters (Capel & Larson 1995)

$t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2} \sim 90$ d (Yeh & Kastenberg 1991);

measured rate constant $k = (15 \pm 2) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and $21 \pm 1^\circ\text{C}$, with $t_{1/2} = 37$ min at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 7704\text{--}39672$ h, based on hydrolysis half-life (Dilling et al. 1975; quoted, Howard et al. 1991) and anaerobic sediment grab sample data (Barrio-Lage et al. 1986; quoted, Howard et al. 1991)

$t_{1/2} \sim 2.0$ yr in the ground water in the Netherlands (estimated, Zoeteman et al. 1981);

$t_{1/2} \sim 86$ d (Yeh & Kastenberg 1991).

Soil: $t_{1/2} < 10$ d (Ryan et al. 1988);

$t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2} \sim 43$ d in upper soil and $t_{1/2} \sim 86$ d in lower soil (Yeh & Kastenberg 1991).

Sediment: $t_{1/2} \sim 43$ d (estimated, Yeh & Kastenberg 1991).

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980);

$t_{1/2} < 10$ d, subject to plant uptake via volatilization (Ryan et al. 1988).

TABLE 5.1.1.30.1

Reported aqueous solubilities of trichloroethylene at various temperatures

$$S/(\text{wt}\%) = 0.10494 + 4.9038 \times 10^{-5} \cdot (t/^\circ\text{C}) + 6.4541 \times 10^{-6} \cdot (t/^\circ\text{C})^2 - 1.8808 \times 10^{-8} \cdot (t/^\circ\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 1.4049 - 8.2223 \times 10^{-3} \cdot (T/\text{K}) + 1.3218 \times 10^{-5} \cdot (T/\text{K})^2 \quad (2)$$

5.1.1.31 Tetrachloroethylene

Common Name: Tetrachloroethylene

Synonym: ethylene tetrachloride, perchloroethene, perchloroethylene, tetrachloroethene, 1,1,2,2-tetrachloro-ethylene

Chemical Name: tetrachloroethylene

CAS Registry No: 127-18-4

Molecular Formula: C_2Cl_4 , $CCl_2=CCl_2$

Molecular Weight: 165.833

Melting Point ($^{\circ}C$):

-22.3 (Lide 2003)

Boiling Point ($^{\circ}C$):

121.3 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.62272, 1.61446 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959)

1.6227 (Horvath 1982; Weast 1982-83)

1.62283, 1.61431 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

102.0 ($20^{\circ}C$, calculated-density)

128.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

39.61, 34.72 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.56 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

150 (selected from literature or measured in DuPont laboratories, data also presented in graph, temp range $0-80^{\circ}C$, McGovern 1943)

150 ($20^{\circ}C$, McConnell et al. 1975; Pearson & McConnell 1975)

130, 120, 140 (1.5, 20, $25^{\circ}C$, selected from literature, Dilling 1977)

200 ($20^{\circ}C$, shake flask-GC, Chiou et al. 1977)

400 (shake flask-GC, Freed et al. 1979)

136 ($37^{\circ}C$, shake flask-GC, Sato & Nakijima 1979)

486 (shake flask-LSC, Banerjee et al. 1980)

200 (shake flask-titration/turbidity, Coca & Diaz 1980, Coca et al. 1980)

478 (shake flask-LSC, Veith et al. 1980)

150* (summary of literature data, temp range $0-80^{\circ}C$, Horvath 1982)

242 ($23-24^{\circ}C$, shake flask-GC, Broholm et al. 1992)

286* ($19.5^{\circ}C$, shake flask-GC/TC, measured range $0-91.8^{\circ}C$, Stephenson 1992)

256 (activity coeff. by inert gas stripping-GC, Li et al. 1993)

258.8 ($20^{\circ}C$, limiting activity coeff. by inert air stripping-GC, Hovorka & Dohnal 1997)

206* (tentative value, temp range $0-70^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(wt\%) = 0.26479 - 1.5487 \times 10^{-3} \cdot (T/K) + 2.4477 \times 10^{-6} \cdot (T/K)^2$, temp range 273-343 K (equation derived from reported solubility data, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999)

192.3* ($22^{\circ}C$, batch equilibrium-GC, sample prepared at 1.0 MPa, measure range $22-161^{\circ}C$, Knauss et al. 2000)

215 (deionized water, batch equilibrium, Ladaa et al. 2001)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 2666 (extrapolated, data presented in graph, McGovern 1943)
 2397* (Antoine eq. regression, temp range -20.6 to 120.8°C, Stull 1947)
 2462 (calculated-Antoine eq., Dreisbach 1959; quoted, Hine & Mookerjee 1975)
 $\log(P/\text{mmHg}) = 7.02003 - 1415.5/(221.0 + t/^\circ\text{C})$; temp range 34–187°C (Antoine eq. for liquid state, Dreisbach 1959)
 2453* (vapor-liquid equilibrium VLE data, measured range 27.887–108°C, Polák et al. 1970)
 $\log(P/\text{mmHg}) = 7.05854 - 1438.947/(233.368 + t/^\circ\text{C})$; temp range 27.887–108°C (ebulliometry, Polák et al. 1970)
 4524* (37.088°C, temp range 37.088–119.650°C, Boublik & Aim 1972; quoted, Boublik et al. 1984)
 2394 (calculated-Antoine eq., Weast 1972–73)
 $\log(P/\text{mmHg}) = [-0.2185 \times 9240.5/(T/\text{K})] + 8.026207$; temp range -20.6 to 120.8°C (Antoine eq., Weast 1972–73)
 2388 (calculated-Antoine eq., Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 6.97183 - 1386.915/(217.526 + t/^\circ\text{C})$; temp range 37–119°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 1866 (20°C, McConnell et al. 1975; Pearson & McConnell 1975)
 640, 1893, 2480 (1.5, 20, 25°C, interpolated from literature data, Dilling 1977)
 2417, 2456 (calculated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.10343 - 1387.956/(217.64 + t/^\circ\text{C})$, temp range: 37–120°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 6.19467 - 1445.722/(224.074 + t/^\circ\text{C})$, temp range: 26.9–108°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 2465 (Daubert & Danner 1986; quoted, Howard 1990)
 2462 (selected, Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.10170 - 1386.90/(217.52 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 2415 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.1017 - 1386.9/(-55.63 + T/\text{K})$, temp range: 310–393 K, (Antoine eq., Stephenson & Malanowski 1987)
 2479, 4319 (quoted, calculated-UNIFAC activity coeff., Banerjee et al. 1990)
 $\log(P/\text{mmHg}) = 30.4038 - 1.5265 \times 10^3/(T/\text{K}) - 8.783 \cdot \log(T/\text{K}) - 2.6364 \times 10^{-9} \cdot (T/\text{K}) + 9.4381 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 142–306 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 2718 (exptl.-1/K_{AW} = C_w/C_A, Hine & Mookerjee 1975)
 248, 581 (calculated-group contribution method, calculated-bond contribution, Hine & Mookerjee 1975)
 1621 (20°C, batch stripping-GC, Mackay et al. 1979)
 2006 (20°C, calculated-P/C, Kavanaugh & Trussell 1980)
 $\log(H/\text{atm}) = 10.38 - 2159.0/(T/\text{K})$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)
 1635* (equilibrium cell-concn ratio-GC/FID, measured range 1–26.1°C, Leighton & Calo 1981)
 $\ln(k_H/\text{atm}) = 16.05 - 3539/(T/\text{K})$; temp range 1.0–26.1°C (equilibrium cell-concn ratio, Leighton & Calo 1981)
 1528 (20°C, gas stripping-GC, Munz & Roberts 1982)
 1316 (20°C, EPICS-GC, Lincoff & Gossett 1983; Gossett 1985)
 1317; 1175 (20°C, EPICS-GC; gas stripping-GC, measured range 10–30°C, Lincoff & Gossett 1984)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 13.12 - 5119/(T/\text{K})$; temp range 10–30°C (EPICS measurements, Lincoff & Gossett 1984)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 11.32 - 4622/(T/\text{K})$; temp range 10–30°C (batch air stripping measurements, Lincoff & Gossett 1984)
 2908 (adsorption isotherm, Urano & Murata 1985)
 1445 (20°C, multiple equilibration, Munz & Roberts 1986)
 1852* (EPICS-GC, measured range 9.6–34.6°C, Gossett 1987)
 $\ln[H/(\text{atm m}^3/\text{mol})] = 12.45 - 4918/(T/\text{K})$; temp range 9.6–34.6°C (EPICS measurements, Gossett 1987)
 1445 (20°C, EPICS-GC, Munz & Roberts 1987)
 $\log K_{AW} = 5.92 - 1802/(T/\text{K})$; temp range 10–30°C (EPICS-GC measurements, Munz & Roberts 1987)

- 2908 (gas stripping-GC, Warner et al. 1987)
 1304 (20°C, EPICS-GC, Yurteri et al. 1987)
 1733* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm}\cdot\text{m}^3/\text{mol})] = 10.65 - 4368/(T/K)$; temp range 10–30°C (EPICS-GC, Ashworth et al. 1988)
 1363* (tap water, EPICS-GC, temp range 25–47.2°C, Tancréde & Yanagisawa 1990)
 $\log K_{AW} = 7.481 - 2279/(T/K)$; temp range 25–47.2°C (EPICS-GC, Tancréde & Yanagisawa 1990)
 2721 (computed value, Yaws et al. 1991)
 1759* (40°C, equilibrium headspace-GC, measured range 40–80°C, Kolb et al. 1992)
 $\ln (1/K_{AW}) = -5.13 + 1736/(T/K)$; temp range: 40–80°C (equilibrium headspace-GC measurements, Kolb et al. 1992)
 1599 (γ^∞ from gas stripping-GC, Li et al. 1993)
 1723* (static headspace-GC, temp range 25–45°C, Robbins et al. 1993)
 1490* (EPICS-GC/FID, temp range 2–25°C, Dewulf et al. 1995)
 717, 1914 (6.0, 25°C, EPICS-GC, natural sea water with salinity of 35‰, Dewulf et al. 1995)
 $\ln K_{AW} = -4528/(T/K) + 0.01080\cdot Z + 14.655$; with Z salinity 0–35.5‰, temp range 2–35°C, (EPICS-GC/FID, Dewulf et al. 1995)
 1319 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 1200 (20°C, inert air stripping-GC, Hovorka & Dohnal 1997)
 1710* (equilibrium headspace-GC, temp range 15–45°C, Peng & Wan 1997)
 $\log (k_H/\text{atm}) = 9.06 - 1822/(T/K)$, temp range 15–45°C (headspace-GC measurements, Peng & Wan 1997)
 1260 (20°C, headspace equilibrium-GC, Peng & Wan 1998)
 2200* (sea water 36‰ NaCl, headspace-GC, temp range 15–45°C, Peng & Wan 1998)
 $\log (k_H/\text{atm}) = 9.09 - 1795/(T/K)$; sea water 36‰ NaCl, temp range 15–45°C (headspace-GC measurements, Peng & Wan 1998)
 1159.2 (20°C, exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)
 2890 (modified EPICS method-GC, Ryu & Park 1999)
 1781* (calculated-P/C(exptl. measured), temp range 22–161°C, Knauss et al. 2000)
 1690 (static headspace method, Ladaa et al. 2001)
 1299 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{AW} = 6.394 - 1955/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C. Additional data at other temperatures designated * are compiled at the end of this section:

- 2.60 (shake flask-GC, Chiou et al. 1977)
 2.60 (shake flask, Hansch & Leo 1979)
 2.53 (shake flask-LSC, Banerjee et al. 1980)
 2.53 (shake flask-LSC, Veith et al. 1980,1983; Veith & Kosian 1982)
 2.67 (RP-HPLC-RT correlation, Veith et al. 1980)
 3.78 (HPLC-RT correlation, McDuffie 1981)
 3.30, 2.72–3.57 (shake flask method: mean, range of mean values, OECD 1981)
 3.40 (shake flask, Hansch & Leo 1985, 1987)
 3.40 (correction of Ball & Roberts 1991 selection, Ball & Roberts 1992)
 3.40 (recommended, Sangster 1993)
 3.40 (recommended, Hansch et al. 1995)
 2.27* (24.8°C, EPICS-GC, measured range 2.2–24.8°C Dewulf et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 3.48 (head-space GC/FID, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 1.59 (trout, Neely et al. 1974)
 1.598 (trout muscle, calculated-ratio of rate const. k_1/k_2 , Neely et al. 1974)
 1.45–1.88 (calculated- K_{OW} , Veith et al. 1979; Veith et al. 1980)
 –1.70 (male Albino rats, Geyer et al. 1980)
 1.69 (bluegill sunfish, Barrows et al. 1980)

- 1.49 (calculated-S, Kenaga 1980)
- 1.69 (bluegill sunfish, Veith et al. 1980; Veith & Kosian 1982)
- 2.35 (calculated- K_{OW} , Lyman et al. 1982)
- 2.40 (microorganisms-water, Mabey et al. 1982)
- 2.06 (rainbow trout, Veith & Kosian 1982)
- 1.70 (calculated-MCI χ , Koch 1983)
- 1.70, 2.30 (quoted, calculated, Sabljic 1987)
- 1.60 (calculated-solvatochromic parameters, Hawker 1990)
- 2.40 (calculated- K_{OW} , McCarty et al. 1992)
- 1.79 (rainbow trout, Saito et al. 1992)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

- 2.38 (calculated, Kenaga & Goring 1980, Kenaga 1980)
- 2.32 (soil, equilibrium sorption isotherm, Chiou et al. 1979)
- 2.14; 2.54, 2.89; 2.35, 2.57 (calculated- K_{OW} ; calculated-S and mp; calculated-S, Karickhoff 1981)
- 2.23 (average of 3 sediments and 5 soils, batch equilibrium, Schwarzenbach & Westall 1981)
- 2.04 (Schwarzenbach & Westall 1981)
- 3.23 (calculated- K_{OW} , Lyman et al. 1982)
- 2.38 (peaty soil, calculated- K_{OM} , Friesel et al. 1984)
- 2.56 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)
- 2.56 (soil, Chiou et al. 1988)
- 2.00 (untreated Marlette soil A horizon, organic carbon OC 2.59%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.76, 2.53 (organic cations treated Marlette soil A horizon: HDTMA treated OC 6.48%; DDTMA treated, OC 4.37%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 1.75 (untreated Marlette soil B_t horizon, OC 0.30%, batch equilibrium, Lee et al. 1989)
- 2.87, 2.78 (organic cations treated Marlette soil B_t horizon: HDTMA treated OC 3.72%, DDTMA treated OC 1.98%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.64 (20°C, soil, sand and loess, sorption isotherm-headspace method, Grathwohl 1990)
- 3.29 (20°C, weathered shale and mudrock, sorption isotherm-headspace method, Grathwohl 1990)
- 4.03 (20°C, unweathered shale and mudrock, sorption isotherm-headspace method, Grathwohl 1990)
- 2.39, 2.57 (20°C, calculated- K_{OW} , Grathwohl 1990)
- 2.14 (calculated-molecular conductivity index, Olsen & Davis 1990)
- 2.45 (2.57% organic carbon in surface soil, Pignatello 1990,1991)
- 1.81–2.95 (calculated- K_{OW} , Ball & Roberts 1991)
- 3.60 (Borden organic phase with no mineral sorption, Ball & Roberts 1991)
- 2.90 (Borden organic phase with no mineral sorption but with Curtis et al. 1986 correlation, Ball & Roberts 1992)
- 2.62, 2.79, 2.74, 2.80, 2.85, 2.78, 2.83 (2.3, 3.8, 6.2, 8.0, 13.5, 18.6, 25°C, natural sediment from River Leie, organic carbon f_{OC} = 4.12%, EPICS-GC/FID, Dewulf et al. 1999)
- 0.393–1.943 (19 soils from U.S. and China with polar organic carbon POC ranging from 2.89–59.9% and organic carbon OC ranging from 1.08–50.8%, batch sorption equilibrium, Kile et al. 1999)
- 1.13–2.11 (9 freshwater sediments from U.S. and China with polar organic carbon POC ranging from 5.36–52.5% and organic carbon OC ranging from 0.58–5.62%, batch sorption equilibrium, Kile et al. 1999)
- 2.32, 2.45, 2.22 (soils: organic carbon OC \geq 0.1%, OC \geq 0.5%, 0.1 \leq OC < 0.5%, average, Delle Site 2001)

Sorption Partition Coefficient, log K_{OM} :

- 1.70 (untreated A horizon Marlette soil, Lee et al. 1989)
- 2.56, 2.30(A horizon Marlette soil treated with HDTMA, DDTMA, Lee et al. 1989)
- 1.64 (untreated B_t horizon Marlette soil, Lee et al. 1989)
- 2.75, 2.64 (treated B_t horizon Marlette soil with HDTMA, DDTMA, Lee et al. 1989)
- 2.32, 1.90 (quoted, calculated-molecular conductivity index, Olsen & Davis 1990)
- 3.20; 2.40 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization: evaporation $t_{1/2}(\text{exptl}) = (27 \pm 3)$ min for 1 mg/L in water when stirred at 200 rpm at approximately 25°C in an open container of 65 mm deep and $t_{1/2}(\text{calc}) = 0.56$ min (Dilling et al. 1975; quoted, Callahan et al. 1979; Mills et al. 1982)

Evaporation $t_{1/2}(\text{exptl}) = 20\text{--}27.1$ min, $t_{1/2}(\text{calc}) = 0.20, 26.5$ min at 20–25°C, and $t_{1/2}(\text{exptl}) = 37.5$ min, $t_{1/2}(\text{calc}) = 27$ min at 15°C from water (Dilling 1977)

ratio of evaporation rate constant to that of oxygen reaeration: a measured value of 0.44 to that of 0.40 as predicted (Smith et al. 1980);

$t_{1/2} = 5\text{--}12$ d from pond, $t_{1/2} = 3$ h–7 d from river, $t_{1/2} = 3.6\text{--}14$ d from lake were estimated using representative reaeration rates (Lyman et al. 1982; quoted, Howard 1990);

estimated $t_{1/2} \sim 4.2$ h from water (Thomas 1982);

rate constants: $k = 0.028$ d⁻¹, $t_{1/2} = 25$ d in spring at 8–16°C, $k = 0.051$ d⁻¹, $t_{1/2} = 14$ d in summer at 20–22°C, $k = 0.056$ d⁻¹, $t_{1/2} = 12$ d in winter at 3–7°C for the periods when volatilization appears to dominate, and $k = 0.057$ d⁻¹, $t_{1/2} = 12.1$ d with HgCl₂, and $k = 0.058$ d⁻¹, $t_{1/2} = 12.0$ d without HgCl₂ as poison in September 9–15, in marine mesocosm experiments (Wakeham et al. 1983).

Photolysis: photocatalyzed mineralization by the presence of TiO₂ with the rate of 6.8 ppm/min per gram of catalyst (Ollis 1985); rate constant of 3.09×10^{-3} h⁻¹ with H₂O₂ under photolysis at 25°C in F-113 solution and with HO⁻ in the gas (Dilling et al. 1988).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{O}_3} < 2 \times 10^{-23}$ cm³ molecule⁻¹ s⁻¹ at 297 K (Mathias et al. 1974; quoted, Atkinson & Carter 1984; Tuazon et al. 1984; Atkinson et al. 1987)

$k_{\text{OH}} = 1.3 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ with a lifetime about 10 d (Yung et al. 1975; quoted, Callahan et al. 1979)

$k_{\text{OH}} = 1.7 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at 296 K (discharge flow system-LMR, Howard 1976)

$k_{\text{OH}}^* = (1.69 \pm 0.07) \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at 297 K, measured range 297–420 K with calculated lifetime of 0.4–0.6 yr in troposphere (discharge flow system-RF, Chang & Kaufman 1977)

$k_{\text{OH}} = (0.13 \pm 0.04) \times 10^{10}$ cm³ M⁻¹ s⁻¹ at 1 atm and 305 ± 2 K (relative rate method, Winer et al. 1978)

$k_{\text{OH}} = 1.70 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at room temp. (Atkinson et al. 1979, 1982; quoted, Tuazon et al. 1984; Atkinson et al. 1987)

$k_{\text{OH}} = 1.7 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹, residence time of 68 d, loss of 1.5% in one day or 12 sunlit hour at 300 K in urban environments (Singh et al. 1981)

$k_{\text{OH}} = 1.0 \times 10^{11}$ cm³ mol⁻¹ s⁻¹, and $k_{\text{O}_3} = 1.0 \times 10^3$ cm³ mol⁻¹ s⁻¹ at 300 K (estimated, Lyman 1982)

$k \ll 100$ M⁻¹ h⁻¹ for singlet oxygen 25°C (Mabey et al. 1982)

completely degraded in an hour (Dimitriades et al. 1983; quoted, Howard 1990)

$k < 0.1$ M⁻¹ s⁻¹ for reaction with ozone in water at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{\text{O}_3} < 2 \times 10^{-23}$ cm³ molecule⁻¹ s⁻¹, $k_{\text{OH}} = 1.7 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at room temp. (Tuazon et al. 1984)

$k_{\text{OH}}^* = 1.67 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at 298 K (recommended, Atkinson 1985)

$k_{\text{OH}}(\text{calc}) = 4.2 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹, $k_{\text{OH}}(\text{obs.}) = 1.7 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at room temp. (SAR [structure-activity relationship], Atkinson 1985)

$k_{\text{NO}_3} < 4.0 \times 10^{-17}$ cm³ molecule⁻¹ s⁻¹ at 298 ± 2 K (relative rate method, Atkinson et al. 1987)

$k_{\text{NO}_3} < 4.0 \times 10^{-17}$ cm³ molecule⁻¹ s⁻¹ with a calculated atmospheric lifetime $\tau > 240$ d, $k_{\text{OH}} = 1.7 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ with lifetime $\tau = 140$ d, and $k_{\text{O}_3} < 2 \times 10^{-23}$ cm³ molecule⁻¹ s⁻¹ with a lifetime $\tau > 2 \times 10^3$ yr at room temp. (Atkinson et al. 1987)

$k_{\text{OH}}(\text{calc}) = 1.8 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹, $k_{\text{OH}}(\text{obs.}) = 1.66 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at room temp. (SAR [structure-activity relationship], Atkinson 1987)

$k_{\text{OH}} = 2.34 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ at 298 K, $k_{\text{NO}_3} = 9.7 \times 10^{-17}$ cm³ molecule⁻¹ s⁻¹ at 296 K (Atkinson 1990)

$k_{\text{NO}_3} < 5.20 \times 10^{-17}$ cm³ molecule⁻¹ s⁻¹ relative to ethene at 298 ± 2 K (Atkinson 1991)

Hydrolysis: $k = 0.079$ month⁻¹ at 25°C with $t_{1/2} = 8.8$ months (Dilling et al. 1975; quoted, Callahan et al. 1979); abiotic hydrolysis or dehydrohalogenation $t_{1/2} = 8.8$ months (Olsen & Davis 1990)

Biodegradation: aqueous aerobic $t_{1/2} = 4320\text{--}8640$ h, based on aerobic river die-away test data (Mudder 1981; quoted, Howard et al. 1991) and saltwater grab sample test data (Jensen & Rosenberg 1975; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2352\text{--}39672$ h, based on anaerobic screening test data (Bouwer et al. 1981; quoted, Howard et al. 1991);

first-order $k = 1.1$ yr⁻¹ with $t_{1/2} = 230$ d (Roberts et al. 1982; quoted, Olsen & Davis 1990)

$t_{1/2} = 34$ d (Wood et al. 1985; quoted, Olsen & Davis 1990).

$t_{1/2}(\text{aerobic}) = 180$ d, $t_{1/2}(\text{anaerobic}) = 98$ d in natural waters (Capel & Larson 1995)

Biotransformation: estimated rate constant for bacteria $k = 1 \times 10^{-10}$ ml cell⁻¹ h⁻¹ (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 3.323$ h⁻¹; $k_2 = 0.0823$ h⁻¹ (trout muscle, Neely et al. 1974)

$k_1 = 11.4$ h⁻¹ (flagfish, calculated-BCF $\times k_1$, McCarty et al. 1992)

$k_2 = 0.0454$ h⁻¹ (flagfish, estimated-one compartment first-order kinetic, McCarty et al. 1992)

$k_1 = 3.30$ h⁻¹; $k_2 = 0.0833$ h⁻¹ (trout, Hawker & Connell 1985)

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} = 12$ wk, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

disappearance $t_{1/2} > 10$ d for the reaction with OH radical (Darnall et al. 1976);

lifetime ~ 10 d, based on reaction with OH radical (Yung et al. 1975; quoted, Callahan et al. 1979);

photodecomposition $t_{1/2} = 14.2$ h with NO and $t_{1/2} = 8.3$ h with NO₂ under simulated atmospheric conditions (Dilling et al. 1976);

estimated N. troposphere residence time of 150 d by one compartment nonsteady state model (Singh et al. 1978);

lifetime of 1.0 yr in troposphere (Altshuller 1980);

residence time of 68 d, loss of 1.5% in 1 d or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

estimated troposphere residence time of 200–390 d (Lyman 1982);

$t_{1/2} = 384$ – 3843 h, based on measured rate data for the vapor phase reaction with OH radical in air (Atkinson 1985; quoted, Howard et al. 1991);

atmospheric lifetimes: $\tau > 240$ d for the reaction with NO₃ for a 12-h nighttime average concentration of 2.4×10^9 molecule/cm³, $\tau = 140$ d for the reaction with OH radical for a 12-h average concentration of 1.0×10^6 molecule/cm³, and $\tau > 2000$ yr for the reaction with O₃ for a 24-h average concentration of 7×10^{11} molecule/cm³ (Atkinson et al. 1987).

Surface water: estimated $t_{1/2} = 9.9$ – 32 d in surface waters at various locations in case of a first order reduction process; $t_{1/2} = 3$ – 30 d in rivers, $t_{1/2} = 30$ – 300 d in lakes and ground waters (Zoeteman et al. 1980)

$t_{1/2} = 25$ d in spring at 8–16°C, 14 d in summer at 20–22°C and 12 d in winter at 3–7°C when volatilization dominates, and $t_{1/2} = 12.1$ d and 12.0 d for experiments with and without HgCl₂ as poison respectively in September 9–15 in marine mesocosm (Wakeham et al. 1983)

$t_{1/2} = 4320$ – 8640 h, based on aerobic river die-away test data (Mudder 1981; quoted, Howard et al. 1991) and saltwater sample grab data (Jensen & Rosenberg 1975; quoted, Howard et al. 1991);

calculated $t_{1/2} = 10$ d and 32 d concentration reduction between sampling points on the Rhine River and a lake in the Rhine basin, respectively (Zoeteman et al. 1980; quoted, Howard 1990)

$t_{1/2}(\text{aerobic}) = 180$ d, $t_{1/2}(\text{anaerobic}) = 98$ d in natural waters (Capel & Larson 1995).

Ground water: $t_{1/2} = 8640$ – 17280 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} < 10$ d (Ryan et al. 1988);

$t_{1/2} = 4320$ – 8640 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $t_{1/2} < 1$ d in tissues of bluegill sunfish (Barrows et al. 1980);

$t_{1/2} = 14$ h, clearance from fish in simulated ecosystem (Neely 1980);

$t_{1/2} < 10$ d, subject to plant uptake via volatilization (Ryan et al. 1988);

$t_{1/2} = 0.4$ – 0.5 d to eliminate from small fish (McCarty et al. 1992).

TABLE 5.1.1.31.1

Reported aqueous solubilities of tetrachloroethylene at various temperatures

$$S/(\text{wt}\%) = 1.49696 \times 10^{-2} - 7.8009 \times 10^{-6} \cdot (t/^{\circ}\text{C}) - 5.1403 \times 10^{-7} \cdot (t/^{\circ}\text{C})^2 + 3.6938 \times 10^{-8} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 0.26479 - 1.5487 \times 10^{-3} \cdot (T/\text{K}) + 2.4477 \times 10^{-6} \cdot (T/\text{K})^2 \quad (2)$$

5.1.1.32 1,3-Dichloropropene

Common Name: 1,3-Dichloropropene

Synonym: 1,3-dichloropropylene, 1,3-dichloro-1-propene, Telone II

Chemical Name: 1,3-dichloropropene

CAS Registry No: 542-75-6

Molecular Formula: $C_3H_4Cl_2$, $CH_2ClCH=CHCl$

Molecular Weight: 110.970

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

112.0 (*trans*-stereoisomer I, Horvath 1982; McNally & Grob 1984; Dean 1985; Lide 2003)

104.3 (*cis*-stereoisomer II, Horvath 1982; McNally & Grob 1984; Dean 1985; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.224 (*trans*-stereoisomer I, Horvath 1982; McNally & Grob 1984)

1.217 (*cis*-stereoisomer II, Horvath 1982; McNally & Grob 1984)

Molar Volume (cm^3/mol):

91.2 (*trans*-stereoisomer I, $20^{\circ}C$, calculated-density)

90.7 (*cis*-stereoisomer II, $20^{\circ}C$, calculated from density)

108.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

2800 (*trans*-stereoisomer I, Dilling 1977)

2700 (*cis*-stereoisomer II, Dilling 1977)

2723 (recommended, Horvath 1982)

1071 (*trans*-stereoisomer I, headspace-GC, McNally & Grob 1983)

1088 (*cis*-stereoisomer II, headspace-GC, McNally & Grob 1983)

1020 ($30^{\circ}C$, *trans*-stereoisomer I, headspace-GC, McNally & Grob 1984)

911 ($30^{\circ}C$, *cis*-stereoisomer II, headspace-GC, McNally & Grob 1984)

1000 ($20^{\circ}C$, Wauchope et al. 1992)

2250 (Wauchope et al. 1992)

4533, 4311, 4223 ($20, 30, 40^{\circ}C$, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated):

4533, 5733 (*trans*-, *cis*-stereoisomer, data from Dow Chemicals, Dilling 1977)

435, 569 (quoted, calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)

3333 ($20^{\circ}C$, selected, Mills et al. 1982)

3334 ($20^{\circ}C$, quoted, Warner et al. 1987)

3866 ($20^{\circ}C$, Wauchope et al. 1992)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated):

232 (calculated-P/C, Dilling 1977)

137 (calculated-P/C, Warner et al. 1987)

122, 198, 302 ($20, 30, 40^{\circ}C$, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.98 (selected, Mills et al. 1982)

1.41 (quoted, Verhaar et al. 1992)

1.84 (*cis/trans*, calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

1.505 (soil, selected, Wauchope et al. 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 31$ min in water from stirring in an open container of depth 65 mm at 200 rpm (Dilling et al. 1975)

$t_{1/2}(\text{exptl}) = 29.6$ min, $t_{1/2}(\text{calc}) = 2.4$ min, 23.8 min for *cis*-stereoisomer, and $t_{1/2}(\text{calc}) = 3.2$ min, 24.6 min for *trans*-stereoisomer from water (Dilling 1977)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (7.74 \pm 0.2) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ *cis*-isomer, $k_{OH} = (1.31 \pm 0.05) \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹ for *trans*-isomer at $22 \pm 2^\circ\text{C}$, calculated $t_{1/2} = 12$ h and 7 h for the *cis*- and *trans*-isomer, respectively (relative rate method, Tuazon et al. 1984)

$k_{O_3} = 1.5 \times 10^{-19}$ cm³ molecule⁻¹ s⁻¹ *cis*-isomer, $k_{O_3} = 6.7 \times 10^{-19}$ cm³ molecule⁻¹ s⁻¹ for *trans*-isomer at room temp., calculated $t_{1/2} = 52$ d and 12 d for *cis*- and *trans*-isomer, respectively (relative rate method, Tuazon et al. 1984)

$k_{OH}(\text{calc}) = 1.1 \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹, $k_{OH}(\text{obs.}) = 7.5 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for *cis*-isomer; $k_{OH}(\text{calc}) = 1.3 \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹, $k_{OH}(\text{obs.}) = 1.26 \times 10^{-11}$ cm³ molecule⁻¹ s⁻¹ for *trans*-isomer at room temp. (SAR [structure-activity relationship], Atkinson 1985)

$k_{OH}(\text{calc}) = 8.8 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹, $k_{OH}(\text{obs.}) = 8.45 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for *cis*-isomer; $k_{OH}(\text{calc}) = 10.0 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹, $k_{OH}(\text{obs.}) = 14.4 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for *trans*-isomer at room temp. (SAR [structure-activity relationship], Atkinson 1987)

Hydrolysis: $t_{1/2} = 133$ –271 h, based on measured rate constants for hydrolysis at pH 7 and 25°C (Mill et al. 1985; quoted, Howard et al. 1991) and pH 5 and 20°C (McCall 1987; quoted, Howard et al. 1991); rate of hydrolysis is, however, independent of pH over the range of pH 5 to pH 10 (McCall 1987).

Biodegradation: aqueous aerobic $t_{1/2} = 168$ –672 h, based on unacclimated aqueous aerobic biodegradation screening studies (Tabak et al. 1981; Krijgheld & Van der Gen 1986; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672$ –2688 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 0.24$ –2.4 h from air for the reaction with OH radicals (Darnall et al. 1976);

$t_{1/2}(\text{calc}) = 12$ h and 7 h for the *cis*- and *trans*-isomer, respectively, for reactions with OH radical; $t_{1/2}(\text{calc}) = 52$ d and 12 d for *cis*- and *trans*-isomer, respectively, for reactions with O_3 at room temp. (Tuazon et al. 1984).

$t_{1/2} = 4.66$ –80.3 h, based on measured rate constants for reaction with OH radical and ozone (Howard et al. 1991)

Surface water: $t_{1/2} = 133$ –271 h, based on measured rate of hydrolysis at pH 7 and 25°C (Mill et al. 1985; quoted, Howard et al. 1991) and at pH 5 and 20°C (McCall 1987; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 133$ –271 h, based on measured rate of hydrolysis at pH 7 and 25°C (Mill et al. 1985; quoted, Howard et al. 1991) and at pH 5 and 20°C (McCall 1987; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 133$ –271 h, based on measured rate of hydrolysis at pH 7 and 25°C (Mill et al. 1985; quoted, Howard et al. 1991) and at pH 5 and 20°C (McCall 1987; quoted, Howard et al. 1991).

Biota:

5.1.1.33 Chloroprene

Common Name: Chloroprene

Synonym: 2-chloro-1,3-butadiene

Chemical Name: 2-chloro-1,3-butadiene

CAS Registry No: 126-99-8

Molecular Formula: C_4H_5Cl , $CH_2=CClCH=CH_2$

Molecular Weight: 88.536

Melting Point ($^{\circ}C$):

-130 (Kirk-Othmer 1985; Verschueren 1983; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

59.4 (Weast 1982–83; Dean 1985; Stephenson & Malanowski 1987; Lide 2003)

69.145 (Boublik et al. 1984)

Density (g/cm^3 at $20^{\circ}C$):

0.9583 (Weast 1982–83; Dean 1985)

0.9580 (Verschueren 1983)

Molar Volume (cm^3/mol):

92.4 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

102.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

964000 ($20^{\circ}C$, saturation concentration, Verschueren 1983)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

26660, 36660 ($20^{\circ}C$, $30^{\circ}C$, Verschueren 1983)

28740 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 5.30955 - 793.85/(181.137 + t/^{\circ}C)$, temp range: 20 – $60^{\circ}C$ (Antoine eq. from reported exptl. data Boublik et al. 1984)

28780 (interpolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 6.16150 - 783.45/(197.7 + t/^{\circ}C)$; temp range 20 – $60^{\circ}C$ (Antoine eq., Dean 1985, 1992)

29450 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.652 - 1545.3/(T/K)$; temp range: 279 – $333\ K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.6519 - 1545.0/(T/K)$; temp range 243 – $263\ K$ (Antoine eq.-II, Stephenson & Malanowski 1987)

23200 (quoted, Howard 1989)

$\log(P/mmHg) = 8.9353 - 1.9176 \times 10^3/(T/K) + 0.73836 \cdot \log(T/K) - 8.4743 \times 10^{-3} \cdot (T/K) + 6.0224 \times 10^{-6} \cdot (T/K)^2$; temp range 143 – $525\ K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

3242 (estimated by bond contribution method, Howard 1989)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.03 (Howard 1989)

Bioconcentration Factor, $\log BCF$:

1.342 (estimated- K_{ow} , Lyman et al. 1982; quoted, Howard 1989)

Sorption Partition Coefficient, $\log K_{oc}$:

2.498 (soil, estimated- K_{ow} , Lyman et al. 1982)

1.699 (soil, molecular topology and QSAR, Sabljic 1984)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} \sim 3$ h from a model river 1 m deep with a current velocity of 1 m/s and a wind speed of 3 m/s (estimated, Lyman et al. 1982; quoted, Howard 1989).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 2.9\text{--}27.8$ h, based on estimated rate constants for the reaction with hydroxyl radical and ozone in air (Atkinson & Carter 1984; Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320$ h, based on aqueous aerobic screening test data for vinyl chloride (Helfgott et al. 1977; Freitag et al. 1984; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688\text{--}17280$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 0.24\text{--}2.4$ h from air for the reaction with OH radicals (Darnall et al. 1976);

$t_{1/2} = 1.8$ h for the reaction with photochemically produced hydroxyl radicals and $t_{1/2} = 12$ h for the reaction with ozone in atmosphere (Cupitt 1980; quoted, Howard 1989);

$t_{1/2} = 2.9\text{--}27.8$ h, based on estimated rate constants for reaction with hydroxyl radicals and ozone in air (Atkinson & Carter 1984; Atkinson 1987; quoted, Howard et al. 1991).

Surface water: estimated $t_{1/2} = 6.7\text{--}53$ d in surface waters at various locations in case of a first order reduction process; and $t_{1/2} = 3\text{--}30$ d in rivers, $t_{1/2} = 30\text{--}300$ d in lakes and ground waters (Zoeteman et al. 1980)

$t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.1.34 Hexachlorobutadiene

Common Name: Hexachlorobutadiene

Synonym: HCBd, perchloro-1,3-butadiene

Chemical Name: 1,1,2,3,4,4-hexachloro-1,3-butadiene

CAS Registry No: 87-68-3

Molecular Formula: C_4Cl_6 , $Cl_2C=CClC=CCl_2$

Molecular Weight: 260.761

Melting Point ($^{\circ}C$):

-21.0 (Horvath 1982, Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

215 (Horvath 1982; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.682 (Horvath 1982)

Molar Volume (cm^3/mol):

155.2 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

206.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.20 (Melnikov 1971)

2.00 ($20^{\circ}C$, Pearson & McConnell 1975)

3.23 (shake flask-HPLC, Banerjee et al. 1980)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

20.0 ($20^{\circ}C$, Pearson & McConnell 1975)

$\log(P/kPa) = 6.06503 - 1520.873/(163.685 + t/^{\circ}C)$; temp range 70 – $200^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P_L/kPa) = 6.4781 - 1783.8/(-84.48 + T/K)$; temp range 343 – $484\ K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

2604 (calculated-P/C, Warner et al. 1987)

1044 (batch stripping, Warner et al. 1987)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.74 (HPLC-RT correlation, Konemann et al. 1979)

4.78 (shake flask-HPLC, Banerjee et al. 1980)

4.63 (calculated-fragment const., Könemann 1981)

4.90 (shake flask-GC, both phases, Chiou 1985)

4.78 (recommended, Sangster 1993)

4.78 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

4.70 (Thomann 1989)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 2965\text{--}28650$ h, based on an estimated rate constant for vapor phase reaction with OH radicals (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: no hydrolyzable groups, rate constant at pH 7 is zero (Kollig et al. 1987).

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320$ h, based on monitoring data and acclimated aqueous screen test data (Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688\text{--}17280$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: tropospheric $t_{1/2} \sim 1.0$ wk, when exposed outdoors to diurnal and climatic variations of incident radiation and temperature (Pearson & McConnell 1975)

$t_{1/2} = 2865\text{--}28650$ h, based on estimated photooxidation half-life in air (Howard et al. 1991).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.1.35 Hexachlorocyclopentadiene

Common Name: Hexachlorocyclopentadiene

Synonym: 1,2,3,4,5,5-hexachlorocyclopentadiene, perchlorocyclopentadiene, HCCPD

Chemical Name: 1,2,3,4,5,5-hexachloro-1,3-cyclopentadiene

CAS Registry No: 77-47-4

Molecular Formula: C_5Cl_6

Molecular Weight: 272.772

Melting Point ($^{\circ}C$):

-9 (Lide 2003)

Boiling Point ($^{\circ}C$):

239 (Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$): 1.702

Molar Volume (cm^3/mol):

160.3 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

210.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.805 (Shake flask-LSC Lu et al. 1974)

1.80 (Zepp et al. 1979)

0.805 (Callahan et al. 1979; Dobbs et al. 1980; Geyer et al. 1981; Warner et al. 1987; Isnard & Lambert 1988)

1.80 ($28^{\circ}C$, vapor saturation or shake flask-GC, Wolfe et al. 1982)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

10.84 (Verschuereen 1977; Warner et al. 1987)

10.67 (Wolfe et al. 1982)

11.90 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.4813 - 2804.32/(T/K)$; temp range 335–512 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = -9.7942 - 3.3161 \times 10^3/(T/K) + 10.171 \cdot \log(T/K) - 2.1115 \times 10^{-2} \cdot (T/K) + 9.2045 \times 10^{-6} \cdot (T/K)^2$; temp range 284–746 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$):

2736 (concentration ratio-GC, Wolfe et al. 1982)

1662 (batch stripping; Warner et al. 1987)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.04 (HPLC-RT correlation, McDuffie 1981)

5.04 ($28^{\circ}C$, concentration ratio-GC, Wolfe et al. 1982)

5.26 (HPLC-RT correlation, Eadsforth 1986)

5.04 (recommended, Sangster 1993)

5.04 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

2.53, 2.97, 3.21, 2.65 (algae, snail, mosquito, fish, Lu et al. 1975)

1.47 (fathead minnow, Veith et al. 1979)

3.04, 3.21 (*Chlorella*, calculated-solubility, Geyer et al. 1981)

- 1.47, 4.19 (quoted, calculated- K_{OW} , Mackay 1982)
 3.18, 3.89 (estimated-S and K_{OW} , Isnard & Lambert 1988)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.08 (sediment organic carbon, calculated- K_{OW} , Wolfe et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: appears to be important in flowing waters (Callahan et al. 1979).

Photolysis: near-surface photolysis is an important process with a rate constant $k = 4.9 \text{ d}^{-1}$ with $t_{1/2} = 11 \text{ min}$ (Callahan et al. 1979);

direct photolysis in natural waters in midday sunlight of Athens, Georgia at latitude 34°N and 83°W with $t_{1/2} < 10 \text{ min}$, and near-surface photolysis rate constant $k(\text{calc}) = 3.9 \text{ h}^{-1}$ on cloudless days averaged over both light and dark periods for a year (Wolfe et al. 1982);

photolysis $t_{1/2} = 1.0 \text{ min}$ to 10.7 min , based on photolysis studies in aqueous solutions (Butz et al. 1982; Wolfe et al. 1982; quoted, Howard et al. 1991).

Oxidation: photooxidation $t_{1/2} = 1.0$ to 8.9 h , based on calculated rate constants for the vapor phase reactions with OH radicals and O_3 in air (Cupitt 1980; quoted, Howard et al. 1991).

Hydrolysis: appears to be an important fate process with a rate constant $k = 5.6 \times 10^{-7} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 14 \text{ d}$ (Callahan et al. 1979);

reaction rate constant was independent of pH range of about 3 to 10 under most environmental conditions and an extrapolated rate constant $k = 4 \times 10^{-3} \text{ s}^{-1}$ was found at 25°C with $t_{1/2} = 173 \text{ h}$ (Wolfe et al. 1982; quoted, Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 168$ to 672 h , based on aerobic aqueous screening test data (Tabak et al. 1981; Freitag et al. 1982; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672$ to 2688 h , based on aerobic aqueous biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: $t_{1/2} = 1.0$ to 8.9 h , based on estimated photooxidation half-life in air (Howard et al. 1991).

Surface water: $t_{1/2} = 1.0 \text{ min}$ to 173 h , based on photolysis and hydrolysis half-lives (Howard et al. 1991); measured rate constant $k = (90 \pm 40) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and $25 \pm 2^\circ\text{C}$, with $t_{1/2} = 6 \text{ min}$ at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 173$ to 1344 h , based on aerobic aqueous biodegradation and hydrolysis half-lives (Howard et al. 1991).

Sediment: hydrolysis rate constant in the sediment was assumed to be the same as that of water and decay rate constant $k = 1.5$ to $5.4 \times 10^{-5} \text{ s}^{-1}$ for natural pond sediment-water system (Wolfe et al. 1982).

Soil: $t_{1/2} = 168$ to 672 h , based on aerobic aqueous biodegradation half-life (Howard et al. 1991).

Biota:

5.1.2 BROMOALKANES AND BROMOALKENES

5.1.2.1 Bromomethane

Common Name: Methyl bromide

Synonym: bromomethane, monobromomethane, Embafume, Terabol

Chemical Name: bromomethane, methyl bromide

CAS Registry No: 74-83-9

Molecular Formula: CH_3Br

Molecular Weight: 94.939

Melting Point ($^{\circ}\text{C}$):

-93.68 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

3.5 (Lide 2003)

Density (g/cm^3 at 20°C):

1.6755, 1.6617 (20°C , 25°C , Dreisbach 1961)

Molar Volume (cm^3/mol):

56.7 (20°C , calculated-density)

52.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

23.26, 24.098 (25°C , at bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

13410* (vapor saturation-gravitational method, measured range 10 – 32°C , Haight 1951)

20700, 24140 (20°C , 25°C , gravitational method, Glew & Moelwyn-Hughes 1953)

14400 (Irmann 1965; Hine & Mookerjee 1975)

13400 (Jolles 1966; Günther et al. 1968)

12930 (Korenman et al. 1971)

900 (20°C , Verschueren 1977, 1983)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

256550 (interpolated-Antoine eq. regression, temp range -96.3 to 3.6°C , Stull 1947)

217700 (calculated-Antoine eq., Dreisbach 1959, 1961)

$\log(P/\text{mmHg}) = 6.95965 - 986.59/(238.32 + t/^{\circ}\text{C})$; temp range -58 to 53°C (Antoine eq. for liquid state, Dreisbach 1959, 1961)

$\log(P/\text{mmHg}) = 6.95965 - 986.590/(238.32 + t/^{\circ}\text{C})$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

183900 (calculated-Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 5925.9/(T/\text{K})] + 7.482362$; temp range -96.3 to 190°C (Antoine eq., Weast 1972–73)

218930 (calculated-Antoine eq., Kudchadker et al. 1979)

$\log(P/\text{mmHg}) = 7.08823 - 1044.42/(244.684 + t/^{\circ}\text{C})$ (Antoine eq., Kudchadker et al. 1979)

187000 (20°C , Thomas 1982)

216900, 219000 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.20369 - 1041.723/(244.36 + t/^{\circ}\text{C})$; temp range -69.9 to 4.5°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.2243 - 1049.898/(245.319 + t/^{\circ}\text{C})$; temp range -70 to 3.6°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.21313 - 1044.42/(224.684 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
217680 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.08455 - 986.59/(-34.83 + T/\text{K})$; temp range 201–296 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 29.3988 - 2.0406 \times 10^3/(T/\text{K}) - 7.9966 \cdot \log (T/\text{K}) - 4.1899 \times 10^{-10} \cdot (T/\text{K}) + 5.0174 \times 10^{-6} \cdot (T/\text{K})^2$;
temp range 179–467 K (vapor pressure eq., Yaws 1994)

218630 (selected and summary of literature data, temp range 179.48–318.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

631*; 621 (exptl.-concn ratio, measured range 5 – 80°C ; calculated-P/C, Glew & Moelwyn-Hughes 1953)

$\log \{H/(\text{mmHg} \cdot \text{L}/\text{mol})\} = 73.022 - 22.261 \cdot \log (T/\text{K}) - 4254.8/(T/\text{K})$; temp range 278.16–253.16 K (Glew & Moelwyn-Hughes 1953)

733* (29.43°C , concentration ratio, measured range 29.44 – 49.59°C , Swain & Thornton 1962)

652 (calculated as $1/K_{\text{AW}} \cdot C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)

533 (20°C , calculated-P/C, Mackay & Shiu 1981)

19958 (20°C , calculated-P/C, Mabey et al. 1982)

1317 (calculated-P/C, Thomas 1982)

20260 (20 – 25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

10690 (calculated-P/C, Mackay & Shiu 1990)

687.4 (computed value, Yaws et al. 1991)

204, 515 (0 , 22°C , distilled water, headspace-GC, Elliott & Rowland 1993)

596* (gas-liquid equilibrator-GC, measured range 1.1 – 30.5°C , De Bruyn & Saltzman 1997)

490 (20°C , selected from reported experimental determined values, Staudinger & Roberts 2001)

$\log K_{\text{AW}} = 3.468 - 1221/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.19 (shake flask-GC, Leo et al. 1975)

1.19 (Hansch & Leo 1979; Hansch & Leo 1985)

1.19 (recommended, Sangster 1989)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

2.11 (calculated-infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

0.623 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

0.672 (calculated- K_{OW} , Lyman et al. 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

2.236, 2.241, 2.215 (Naaldwijk loamy sand, Aalsmeer loam, Boskoop peaty clay, Howard 1989)

0.771 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

2.10 (calculated-S, Lyman et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated experimental $t_{1/2} = 27$ min 1 mg/L when stirred at 200 rpm in water at approximately 25°C in an open container (Dilling et al. 1975; quoted, Callahan et al. 1979);

$t_{1/2} \sim 30$ min (Mills et al. 1982);

$t_{1/2} = 3.0$ h in a model river (estimated, Lyman et al. 1982; quoted, Howard 1989);

$t_{1/2} \sim 0.2$ and 0.5 d for the volatilization from 1 and 10 cm of soil, respectively (Jury et al. 1984; quoted, Howard 1989).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}^* = (4.14 \pm 0.43) \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 245–375 K with lifetime of 1.32 yr in the troposphere (flash photolysis-RF, Davis et al. 1976)

$k_{OH} = 3.5 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow system, Howard & Evenson 1976)

$k_{OH} = 4.0 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 289 d, loss of 0.4% in one day or 12 sunlit hour at 300 K (Singh et al. 1981)

$k_{OH} = 2.4 \times 10^{10} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 300 K (estimated, Lyman 1982)

$k_{OH}^* = 3.93 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 0.1 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

photooxidation $t_{1/2} = 1633\text{--}16327 \text{ h}$ in air, based on measured rates for reaction with OH radicals in air (Atkinson 1985; quoted, Howard et al. 1991)

Hydrolysis: first-order $k = 4.0 \times 10^{-7} \text{ s}^{-1}$ with a maximum $t_{1/2} = 20 \text{ d}$ at pH 7 and 25°C (Radding et al. 1977; Mabey & Mill 1978; quoted, Callahan et al. 1979);

$k = 4.09 \times 10^{-7} \text{ s}^{-1}$ with $t_{1/2} = 20 \text{ d}$ at pH 7 and 25°C (Mabey & Mill 1978)

$t_{1/2} = 470\text{--}912 \text{ h}$, based on measured first-order hydrolysis rate constants (Mabey & Mill 1978; Ehrenberg et al. 1974; quoted, Vogel & Reinhard 1986; Howard 1989; Howard et al. 1991);

$k = 1.44 \times 10^{-3} \text{ h}^{-1}$ at pH 7 and 25°C (Callahan et al. 1979; quoted, Mabey et al. 1982)

$k = 3 \times 10^{-7} \text{ s}^{-1}$ at 25°C with $t_{1/2} = 26.7 \text{ d}$ (Castro & Belser 1981; quoted, Howard 1989).

Biodegradation: aerobic $t_{1/2}(\text{aq.}) = 168\text{--}672 \text{ h}$, based on unacclimated aerobic aqueous screening test data for bromoform from experiments utilizing settled domestic wastewater inoculum (Tabak et al. 1981; quoted, Howard et al. 1991);

anaerobic $t_{1/2}(\text{aq.}) = 672\text{--}2688 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Tabak et al. 1981; quoted, Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radicals (USEPA 1974; quoted, Darnall et al. 1976);

lifetime of 3.8 yr in the troposphere (Altshuller 1980);

$t_{1/2} = 0.29 \text{ y}$ in the atmosphere for the reaction with $2 \times 10^6 \text{ OH radicals/cm}^3$ at 25°C (Dilling 1982; quoted, Howard 1989);

$t_{1/2} = 289 \text{ d}$ estimated as toxic chemical residence time with rate constant of $4 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the reaction with OH radicals at 300 K (Singh et al. 1980,1981; quoted, Howard 1989);

$t_{1/2} = 1633\text{--}16327 \text{ h}$, based on measured rates for reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 20 \text{ d}$ at pH 7 and 25°C based on hydrolysis rate constant (Mabey & Mill 1978)

$t_{1/2} = 168\text{--}672 \text{ h}$, based on unacclimated aerobic aqueous screening test data for bromoform from experiments utilizing settled domestic wastewater inoculum (Tabak et al. 1981; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 336\text{--}912 \text{ h}$, based on unacclimated aerobic aqueous screening test data for bromoform from experiments utilizing settled domestic waste water inoculum and hydrolysis half-life (Tabak et al. 1981; Mabey & Mill 1978; Ehrenberg et al. 1974; quoted, Vogel & Reinhard 1986; Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168\text{--}672 \text{ h}$, based on unacclimated aerobic aqueous screening test data for bromoform from experiments utilizing settled domestic wastewater inoculum (Tabak et al. 1981; quoted, Howard et al. 1991).

Biota:

5.1.2.2 Dibromomethane

Common Name: Dibromomethane

Synonym: methylene bromide

Chemical Name: dibromomethane, methylene bromide

CAS Registry No: 74-95-3

Molecular Formula: CH_2Br_2

Molecular Weight: 173.835

Melting Point ($^{\circ}\text{C}$):

-52.5 (Weast 1982-83; Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

97.0 (Horvath 1982; Weast 1982-83; Lide 2003)

Density (g/cm^3 at 20°C):

2.4970, 2.4842 (20°C , 25°C , Dreisbach 1961)

2.4970 (Horvath 1982; Weast 1982-83)

Molar Volume (cm^3/mol):

70.1 (Stephenson & Malanowski 1987)

76.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

11480* (20°C , volumetric method, measured range 0 – 30°C , Rex 1906)

11700, 11930 (15°C , 30°C , shake flask-interferometer, Gross & Saylor 1931)

11486 (Seidell 1940; quoted, Deno & Berkheimer 1960)

17500 (shake flask-residue volume method, Booth & Everson 1948)

11000 (O'Connell 1963; Jolles 1966)

11442* (summary of literature data, Horvath 1982)

11500 (Dean 1985)

12800*, 11400 (19.3°C , 29.5°C , shake flask-GC/TC, measured range 0 – 90.1°C , Stephenson 1992)

11420, 12030, 12270, 12580 (20 , 30 , 35 , 40°C , infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)

11114, 12060, 13052 (20 , 30 , 40°C , activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

12300 (20°C , limiting activity coeff. γ^{∞} by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

4626, 7518 (20°C , 30°C , Rex 1906)

5775* (Antoine eq. regression, temp range -35.1 to 98.6°C , Stull 1947)

6034 (calculated by formula, Dreisbach 1961)

$\log(P/\text{mmHg}) = 7.0625 - 1327.8/(220.58 + t/^{\circ}\text{C})$; temp range 17 – 236°C (Antoine eq. for liquid state, Dreisbach 1961)

5767 (calculated-Antoine eq., Weast 1972-73)

$\log(P/\text{mmHg}) = [-0.2185 \times 8722.0/(T/\text{K})] + 8.028019$; temp range -35.1 to 98.6°C (Antoine eq., Weast 1972-73)

5922 (Antoine eq. regression, Kudchadker et al. 1979)

$\log(P/\text{mmHg}) = 7.82594 - 1784.9/(263.73 + t/^{\circ}\text{C})$ (Antoine eq., Kudchadker et al. 1979)

6034 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.1874 - 1327.8/(-52.57 + T/\text{K})$; temp range 290 – 409 K (Antoine eq., Stephenson & Malanowski 1987)

4650, 7730, 9840, 12383 (20, 30, 35, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log(P/\text{mmHg}) = 35.3525 - 3.0445 \times 10^3/(T/K) - 9.5792 \cdot \log(T/K) + 5.8258 \times 10^{-10} \cdot (T/K) + 2.9443 \times 10^{-6} \cdot (T/K)^2$;
 temp range 221–611 K (vapor pressure eq., Yaws 1994)
 6084.6 (selected and summary of literature data, temp range 220.61–413.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated):

90.0 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)
 73.16 (calculated-bond method, Hine & Mookerjee 1975)
 86.13 (batch stripping-GC, Nicholson et al. 1984)
 86.03 (Munz & Roberts 1989)
 70.9, 111.5, 142, 172 (20, 30, 35, 40°C, infinite dilution activity coeff. γ^∞ -GC, Tse et al. 1992)
 72.7, 141, 252 (20, 30, 40°C, activity coeff. γ^∞ -differential pressure transducer, Wright et al. 1992)
 281, 513 (35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 25.4, 48.3, 81.9 (0, 10, 20°C, seawater of salinity of 30.4‰, gas stripping-GC, Moore et al. 1995)
 $\ln K_{AW} = 11.70 - 4418/(T/K)$; seawater of salinity of 30.4‰, temp range 0–20°C (Moore et al. 1995)
 66.8 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 68.94 (20°C, exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated:

2.50 (Hansch et al. 1968)
 1.70 (recommended, Sangster 1993)
 1.70 (infinite dilution activity coeff.-GC, Tse & Sandler 1994)
 1.70, 1.65, 1.64 (25, 35, 50°C, from infinite dilution activity coefficient determined by relative GC technique, Bhatia & Sandler 1995)
 1.88 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

3.07 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photocatalyzed mineralization by the presence of TiO_2 with the rate of 4.1 ppm/min-g of catalyst (Ollis 1985).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k(\text{aq.}) = (6.1 \pm 0.61) \times 10^{-7} \text{ M}^{-1} \text{ s}^{-1}$ was measured in 66.7% dioxane-water at 35.7°C (Hine et al. 1956; quoted, Roberts et al. 1992)

$k_{OH} = 2.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and estimated residence time of 46 d at 300 K (Singh et al. 1980)

$k_{OH} = 5 \times 10^{11} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, estimated at 300 K (Lyman 1982)

$k(\text{aq.}) = 4.0 \times 10^{-7} \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution with reference to CH_3CCl_3 (Buxton et al. 1988; quoted, Haag & Yao 1992)

$k_{O_3}(\text{aq.}) \leq 0.005 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 21°C, with $t_{1/2} \geq 80$ d at pH 7 (Yao & Haag 1991).

$k_{OH}(\text{aq.}) = (9.0 \pm 3.0) \times 10^{-7} \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution at pH 8.5 (Haag & Yao 1992)

Hydrolysis: rate constant $k = 1.2 \times 10^{-10} \text{ s}^{-1}$ with $t_{1/2} = 183$ yr at pH 7 and 25°C (Mabey & Mill 1978)

$t_{1/2} = 183$ yr at pH 7 and 25°C, based on overall hydrolysis rate constant (Mill et al. 1982; quoted, Howard et al. 1991).

Biodegradation:

$k = 2.1 \times 10^{-4} \text{ min}^{-1}$ with $t_{1/2} = 24$ min in anoxic sediment-water suspension (Jafvert & Wolfe 1987)

$t_{1/2}$ (aq. aerobic) = 168–672 h, based on unacclimated aerobic screening test data for bromoform from experiments utilizing settled domestic wastewater inoculum (Tabak et al. 1981; quoted, Howard et al. 1991);

$t_{1/2}$ (aq. anaerobic) = 672–2688 h, based on unacclimated aqueous aerobic half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2}$ = 2.4–24 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

estimated as toxic chemical residence time of 46 d with rate constant of $2.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the reaction with OH radical at 300 K (Singh et al. 1980);

photooxidation $t_{1/2}$ = 851–8510 h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2}$ = 183 yr at pH 7 and 25°C based on hydrolysis rate constant (Mabey & Mill 1978)

$t_{1/2}$ = 55 h in anoxic sediment-water suspension (Jafvert & Wolfe 1987);

$t_{1/2}$ = 168–672 h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

measured $k \leq 0.005 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 21°C, with $t_{1/2} \geq 80 \text{ d}$ at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2}$ = 336–1344 h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment: $t_{1/2}$ = 55 h in anoxic Bar-H sediment-water suspension (Jafvert & Wolfe 1987)

Soil: $t_{1/2}$ = 168–672 h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.2.3 Tribromomethane

Common Name: Tribromomethane

Synonym: bromoform, methenyl tribromide

Chemical Name: tribromomethane

CAS Registry No: 75-25-2

Molecular Formula: CHBr_3

Molecular Weight: 252.731

Melting Point ($^{\circ}\text{C}$):

8.69 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

149.1 (Lide 2003)

Density (g/cm^3 at 20°C):

2.8910 (Kahlbaum & Arndt 1898; Riddick et al. 1986)

2.8917, 2.8909 (Kudchadker et al. 1979)

Molar Volume (cm^3/mol):

87.42 (20°C , calculated-density)

99.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated):

3010, 3190 (15°C , 30°C , shake flask-interferometer, Gross & Saylor 1931)

3110 (Seidell 1940; quoted, Deno & Berkheimer 1960; Hine & Mookerjee 1975)

3190 (30°C , Seidell 1941)

3033 (Verschuereen 1977)

3100 (recommended, Horvath 1982)

3931 (30°C , headspace-GC, McNally & Grob 1984)

3200 (30°C , Dean 1985)

3180 (30°C , selected, Riddick et al. 1986)

3235, 3452, 3695 (20, 30, 40°C , infinite dilution activity coeff. γ -GC, Tse et al. 1992)

3978, 4555, 3467 (20, 35, 50°C , activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)

3163 (20°C , equilibrium air stripping-GC, Hovorka & Dohnal 1997)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

987* (30°C , temp range 30 – 110°C , Kireev & Simnikow 1941; quoted, Boublik et al. 1984)

667* (22°C , summary of literature data, temp range 22 – 150.5°C , Stull 1947)

2453* (47.207°C , temp range 47.207 – 139.055°C , Boublik & Aim 1972; quoted, Boublik et al. 1984)

815 (calculated-Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 9673.3/(T/K)] + 7.875367$; temp range 22 – 150°C (Antoine eq., Weast 1972–73)

715 (calculated-Antoine eq., Boublik et al. 1973)

$\log(P/\text{mmHg}) = 6.82182 - 1376.748/(200.966 + t/^{\circ}\text{C})$; temp range 30 – 100°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)

720 (calculated-Antoine eq., Kudchadker et al. 1979)

$\log(P/\text{mmHg}) = 7.03141 - 1511.50/(214.21 + t/^{\circ}\text{C})$ (Antoine eq., Kudchadker et al. 1979)

717 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/\text{kPa}) = 5.97839 - 1294.382/(202.729 + t/^{\circ}\text{C})$; temp range 30 – 100.8°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

- $\log (P/\text{mmHg}) = 6.8218 - 1376.7/(201.0 + t/^{\circ}\text{C})$; temp range 30–101°C (Antoine eq., Dean 1985, 1992)
 790 (quoted, Riddick et al. 1986)
 727 (calculated-Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.20911 - 1544.81/(-54.77 + T/\text{K})$; temp range 320–412 K (Antoine eq., Stephenson & Malanowski 1987)
 543, 981, 1704 (20, 30, 40°C, quoted from DIPPR, Tse et al. 1992)
 $\log (P/\text{mmHg}) = -10.2943 - 2.170 \times 10^3/(T/\text{K}) + 9.1193 \cdot \log (T/\text{K}) - 1.6495 \times 10^{-2} \cdot (T/\text{K}) + 7.4917 \times 10^{-6} \cdot (T/\text{K})^2$;
 temp range 281–696 K (vapor pressure eq., Yaws 1994)
 685.5 (selected and summary of literature data, temp range 281.2–478.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 68.3 (calculated- $1/K_{AW}$, C_W/C_A , Hine & Mookerjee 1975)
 7.66 (calculated-bond method, Hine & Mookerjee 1975)
 62.3, 62.0 (calculated-P/C, recommended, Mackay & Shiu 1981, 1990)
 56.7 (20°C, calculated-P/C, Mabey et al. 1982)
 43.6, 43.6; 58.8 (20°C, batch stripping-GC, calculated-P/C, distilled water, Nicholson et al. 1984)
 46.6, 41.54, 43.6 (20°C, batch stripping-GC, natural potable water samples, Nicholson et al. 1984)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 116.0 - 5670/(T/\text{K})$; temp range 10–30°C (air stripping-GC, Nicholson et al. 1984)
 54.2 (EPICS-LSC, Munz & Roberts 1987, 1989)
 $\log K_{AW} = 4.729 - 1905/(T/\text{K})$; temp range 10–30°C (EPICS-LSC measurements, Munz & Roberts 1987)
 53.9 (gas stripping-GC, Warner et al. 1987)
 56.7 (20–25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)
 40.5, 70.9, 122 (20, 30, 40°C, infinite dilution activity coeff. γ^{∞} -GC, Tse et al. 1992)
 34.0, 71.6, 207 (20, 35, 50°C, activity coeff. γ^{∞} -differential pressure transducer, Wright et al. 1992)
 43.6 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 182, 536 (10, 20°C, gas stripping-GC, Moore et al. 1995)
 14.3, 29.2, 52.9 (0, 10, 20°C, seawater of salinity of 30.4‰, gas stripping-GC, Moore et al. 1995)
 $\ln K_{AW} = 13.16 - 4973/(T/\text{K})$; seawater of salinity of 30.4‰, temp range: 0–20°C (Moore et al. 1995)
 42.65 (20°C, selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 5.476 - 2120/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)
 104.4 (37°C, equilibrium headspace-GC, Batterman et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 2.30 (calculated as per Tute 1971, Callahan et al. 1979)
 2.38 (calculated-f const., Mabey et al. 1982; Valsaraj 1988)
 2.67 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

- 1.80 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.07 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization: calculated $t_{1/2} = 63$ min to 24.2 d (using Langbein & Durum 1967 published O_2 reaeration values) and $t_{1/2} = 65.6$ d both from rivers and streams (Kaczmar et al. 1984).
 Photolysis: photocatalyzed mineralization by the presence of TiO_2 with the rate of 6.2 ppm/min per gram of catalyst (Ollis 1985).
 Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:
 $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 0.5 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical at 25°C (Mabey et al. 1982)

photooxidation $t_{1/2} = 1299\text{--}12989$ h, based on estimated rate constant for the reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991)

$k = 4.0 \times 10^7 \text{ M}^{-1} \text{ s}^{-1}$ for reaction with OH radical in water with reference to CH_3CCl_3 (Buxton et al. 1988; quoted, Haag & Yao 1992)

$k_{\text{OH}}(\text{aq.}) = (1.3 \pm 0.6) \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with OH radical in aqueous solution at pH 8.5 (Haag & Yao 1992)

Hydrolysis: a maximum $t_{1/2} = 686$ yr has been estimated at pH 7 and 25°C from experimental data at $100\text{--}150^\circ\text{C}$ (Radding et al. 1977) which corresponds to a first-order rate constant $k = 3.2 \times 10^{-11} \text{ s}^{-1}$ (Radding et al. 1977; Mabey & Mill 1978; quoted, Mabey et al. 1982; Howard et al. 1991);

rate constant $k = 3.2 \times 10^{-11} \text{ s}^{-1}$ with $t_{1/2} = 686$ yr at pH 7 and 25°C (Mabey & Mill 1978)

rate constant $k = 2.5 \times 10^{-9} \text{ h}^{-1}$ assigned by analogy to trichloromethane (Mabey et al. 1982).

Biodegradation: $t_{1/2} = 672\text{--}4320$ h in soil, based on unacclimated aerobic aqueous screening test data from experiments utilizing settled domestic wastewater inoculum (Bouwer et al. 1984; quoted, Howard et al. 1991); anaerobic $t_{1/2} = 2688\text{--}17280$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: estimated rate constant $k \sim 1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 1299\text{--}12989$ h, based on estimated rate constant for the reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 686$ yr at pH 7 and 25°C based on hydrolysis rate constant (Mabey & Mill 1978)

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on unacclimated aerobic aqueous screening test data from experiments utilizing settled domestic wastewater inoculum (Bouwer et al. 1984; quoted, Howard et al. 1991).

Biota:

5.1.2.4 Bromoethane (Ethyl bromide)

Common Name: Ethyl bromide

Synonym: bromoethane, monobromoethane

Chemical Name: ethyl bromide, bromoethane

CAS Registry No: 74-96-4

Molecular Formula: C_2H_5Br , CH_3CH_2Br

Molecular Weight: 108.965

Melting Point ($^{\circ}C$):

-118.60 (Horvath 1982; Dean 1985; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

38.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.4594, 1.4492 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959)

1.4505 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

75.12 (calculated from density)

75.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

27.55, 26.48 ($25^{\circ}C$, at bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.858 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

9140* ($20^{\circ}C$ volumetric method, measured range $0-30^{\circ}C$, Rex 1906)

9600 ($17.5^{\circ}C$, volumetric method, Fühner 1924)

8880 ($30^{\circ}C$, van Arkel & Vles 1936)

9064 (Seidell 1940; quoted, Deno & Berkheimer 1960; Hine & Mookerjee 1975)

9000 (shake flask-interferometry, Donahue & Bartell 1952)

8939* (summary of literature data, temp range $0-30^{\circ}C$, Horvath 1982)

9100 (Dean 1985; Riddick et al. 1986)

9000* (tentative value, temp range $0-^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(wt\%) = 13.2481 - 8.0012 \times 10^{-2} \cdot (T/K) + 1.29448 \times 10^{-4} \cdot (T/K)^2$, temp range $273-303 K$ (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

51440, 75140 ($20^{\circ}C$, $30^{\circ}C$, Rex 1906)

70095* ($28.145^{\circ}C$, temp range $28.145-75.365^{\circ}C$, Zmaczynski 1930)

53329* ($21^{\circ}C$, summary of literature data, temp range -74.3 to $38.4^{\circ}C$, Stull 1947)

62460 (calculated-Antoine eq., Dreisbach 1959)

$\log (P/mmHg) = 6.91995 - 1090.81/(231.71 + t/^{\circ}C)$; temp range -32 to $110^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1959)

$\log (P/mmHg) = 6.91995 - 1090.81/(231.71 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log (P/mmHg) = [-0.2185 \times 6843.1/(T/K)] + 7.635277$; temp range 74.3 to $229.5^{\circ}C$ (Antoine eq., Weast 1972-73)

62230 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.11352 - 1121.957/(234.741 + t/^{\circ}C)$; temp range $28.145-75.4^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 6.9886 - 1121.9/(234.7 + t/^{\circ}\text{C})$; temp range 28–75°C (Antoine eq., Dean 1985, 1992)

62470 (lit; average, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.04485 - 1090.81/(231.71 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

62470 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.04485 - 1090.81/(-41.44 + T/\text{K})$; temp range 225–333 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.66835 - 1151.96/(12.999 + T/\text{K})$; temp range 334–504 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.77490 - 1602.405/(25.282 + T/\text{K})$; temp range 326–454 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.99873 - 1619.697/(T/\text{K})$; temp range 452–503 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 38.1816 - 2.517 \times 10^3/(T/\text{K}) - 10.329 \cdot \log (T/\text{K}) - 2.3368 \times 10^{-10} \cdot (T/\text{K}) + 5.4956 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 155–504 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

766 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

751 (computed value, Yaws et al. 1991)

767 (γ^{∞} from gas stripping-GC, Li et al. 1993)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.60 (calculated- π const., Hansch et al. 1968)

1.61 (shake flask-GC, Hansch et al. 1975; Hansch & Leo 1979, 1987)

1.61 (recommended, Sangster 1989)

1.61 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{AW}$ at 25°C:

1.53 (calculated-measured γ^{∞} in pure octanol and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis: $k = 2.64 \times 10^{-7} \text{ s}^{-1}$ with $t_{1/2} \sim 30 \text{ d}$ at pH 7 and 25°C (Mabey & Mill 1978)

$k = 9.4 \times 10^{-4} \text{ h}^{-1}$ at pH 7 and 25°C with $t_{1/2} \sim 30 \text{ d}$ (Mabey & Mill 1978; quoted, Schwarzenbach et al. 1985; Vogel & Reinhard 1986).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

Surface water: $t_{1/2} \sim 30 \text{ d}$ at pH 7 and 25°C based on hydrolysis rate constant (Mabey & Mill 1978)

TABLE 5.1.2.4.1

Reported aqueous solubilities of bromoethane at various temperatures

$$S/(\text{wt}\%) = 1.0557 - 0.01309 \cdot (t/^\circ\text{C}) + 3.3850 \times 10^{-4} \cdot (t/^\circ\text{C})^2 - 2.950 \times 10^{-6} \cdot (t/^\circ\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 13.2481 - 8.0012 \times 10^{-2} \cdot (T/\text{K}) + 1.29448 \times 10^{-4} \cdot (T/\text{K})^2 \quad (2)$$

FIGURE 5.1.2.4.2 Logarithm of vapor pressure versus reciprocal temperature for bromoethane.

5.1.2.5 1,2-Dibromoethane

Common Name: 1,2-Dibromoethane

Synonym: ethylene bromide, ethylene dibromide, *sym*-dibromoethane, EDB

Chemical Name: 1,2-dibromoethane

CAS Registry No: 106-93-4

Molecular Formula: $C_2H_4Br_2$, CH_2BrCH_2Br

Molecular Weight: 187.861

Melting Point ($^{\circ}C$):

9.84 (Lide 2003)

Boiling Point ($^{\circ}C$):

131.6 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

2.1792, 2.1688 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959; Horvath 1982)

2.1791, 2.1687 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

86.25 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

98.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

41.73, 36.35 ($25^{\circ}C$, at bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.03 (calculated, Dreisbach 1959)

10.945 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

3920, 4310 ($15^{\circ}C$, $30^{\circ}C$, shake flask-interferometer, Gross & Saylor 1931)

4040* (measured range 0 – $50^{\circ}C$, van Arkel & Vles 1936)

4017 (Seidell 1940; quoted, Deno & Berkheimer 1960; Hine & Mookerjee 1975)

8600 (shake flask-volumetric method, Booth & Everson 1948)

4200 (measured by Dow Chemical, Dreisbach 1959)

3510* ($20^{\circ}C$, shake flask-GC, measured range 3 – $34^{\circ}C$, Chiou & Freed 1977)

2910 (shake flask-GC, Jones et al. 1977/78)

3520 (shake flask-GC, Chiou et al. 1979)

4320, 4321 ($20^{\circ}C$, $25^{\circ}C$, shake flask-GC, Mackay et al. 1980)

4152* (summary of literature data, Horvath 1982)

4310 ($30^{\circ}C$, Verschueren 1983)

4290 ($30^{\circ}C$, selected, Riddick et al. 1986)

3120 (shake flask-reverse phase polarography, Tokoro et al. 1988)

4120*, 4310 ($19.5^{\circ}C$, $30.7^{\circ}C$, shake flask-GC/TC, measured range 10.0 – $90.6^{\circ}C$, Stephenson 1992)

4192 ($20^{\circ}C$, limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

3910* (tentative value, temp range 0 – $75^{\circ}C$. IUPAC-NIST Solubility Data Series, Hovath & Getzen 1999a)

$S/(wt\%) = 3.8651 - 2.7921 \times 10^{-2} \cdot (T/K) + 5.45647 \times 10^{-5} \cdot (T/K)^2$, temp range 273 – $348\ K$ (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1333 ($18.2^{\circ}C$, summary of literature data, temp range -27 to $131.1^{\circ}C$, Stull 1947)

1560 (calculated-Antoine eq., Dreisbach 1959)

$\log(P/mmHg) = 7.06245 - 1469.7/(220.0 + t/^{\circ}C)$; temp range 43 – $215^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1959)

$\log (P/\text{mmHg}) = [-0.2185 \times 9229.4/(T/K)] + 7.93581$; temp range -27 to 304°C (Antoine eq., Weast 1972–73)
 1466, 2266 (20°C , 30°C , Verschuereen 1983)
 1626 (interpolated-Antoine eq., Boublik et al. 1984)
 $\log (P/\text{kPa}) = 5.62666 - 1156.346/(2187.446 + t/^\circ\text{C})$; temp range 52.56 – 131.41°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)
 $\log (P/\text{mmHg}) = 6.72148 - 1280.82/(201.75 + t/^\circ\text{C})$; temp range 52 – 131°C (Antoine eq., Dean 1985, 1992)
 1540 (lit. average, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 4.32297 - 1560.3/(230.0 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log (P_s/\text{kPa}) = 10.03 - 2863/(T/K)$; temp range 228 – 248 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_s/\text{kPa}) = 9.009 - 2606.5/(T/K)$; temp range 251 – 281 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.501 - 2181.1/(T/K)$; temp range 283 – 317 K (liquid, Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.18375 - 1469.7/(-53.15 + T/K)$; temp range 316 – 488 K (Antoine eq.-IV, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.16941 - 3200/(117.25 + T/K)$; temp range 404 – 578 K (Antoine eq.-V, Stephenson & Malanowski 1987)
 $\log (P/\text{mmHg}) = 16.8759 - 2.4267 \times 10^3/(T/K) - 3.0891 \cdot \log (T/K) - 6.0088 \times 10^{-10} \cdot (T/K) + 3.5901 \times 10^{-7} \cdot (T/K)^2$; temp range 283 – 650 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

71.49 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)
 15.64, 110.7 (calculated-group contribution method, calculated-bond contribution, Hine & Mookerjee 1975)
 65.86* (EPICS-GC, measured range 10 – 30°C , Ashworth et al. 1988)
 $\ln [H/(\text{atm m}^3 \text{ mol}^{-1})] = 5.703 - 3876/(T/K)$; temp range 10 – 30°C (EPICS-GC, Ashworth et al. 1988)
 71.49, 133.12 (quoted, calculated-QSAR, Nirmalakhandan & Speece 1988)
 83.07 (20 – 25°C and low ionic strength, quoted, Pankow & Rosen 1988; Pankow 1990)
 70.77 (computed value, Yaws et al. 1991)
 52.6 (20°C , equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 52.02 (20°C , exponential saturator EXPSTAT technique, Dohnal & Hovorka 1999)
 54.84 (20°C , selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{AW} = 3.661 - 1556/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.96 (shake flask, Log P Database, Hansch & Leo 1987)
 1.96 (recommended, Sangster 19943)
 1.96 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

0.778 (calculated-S as per Kenaga & Goring 1978, Kenaga 1980)
 0.301 (calculated- K_{OC} as per Kenaga & Goring 1978, Kenaga 1980)

Sorption Partition Coefficient, $\log K_{OC}$:

1.556 (soil, equilibrium sorption isotherm, Chiou et al. 1979)
 1.643 (soil, quoted, Kenaga 1980; Kenaga & Goring 1980)
 1.699 (soil, calculated as per Kenaga & Goring 1978, Kenaga 1980)
 1.643 (soil, selected, Jury et al. 1990)
 1.64 (soil, organic carbon $\text{OC} \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization: estimated volatilization $t_{1/2} \sim 6.1$ h from water (Thomas 1982)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH} = 2.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow system, Howard & Evenson 1976)

$k_{\text{OH}}(\text{calc}) = 2.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 2.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1985)

$k_{\text{OH}} = 2.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.01 d^{-1} , $k_{\text{O}_3} < 10^{-23} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of $< 6 \times 10^{-7} \text{ d}^{-1}$ at room temp. (Atkinson 1985)

$k_{\text{O}_3}(\text{aq.}) \leq 0.014 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C , with a half-life of 28 d at pH 7 (Yao & Haag 1991).

Hydrolysis: EDB hydrolyzes to ethylene glycol and bromoethanol in water at pH 7 and 25°C with $t_{1/2} = 5\text{--}10 \text{ d}$ (Leinster et al. 1978; quoted, Verschueren 1983);

$k = 9.9 \times 10^{-6} \text{ h}^{-1}$ at pH 7 and 25°C with a calculated $t_{1/2} = 8.0 \text{ yr}$ (Jungclaus & Cohen 1986; quoted, Ellington 1989);

rate constant $k = (8.9 \pm 0.1) \times 10^{-9} \text{ s}^{-1}$ in water at 25°C and pH 7.5 with an estimated half-life of 2.5 yr (Vogel & Reinhard 1986);

$t_{1/2} = 2.2 \text{ yr}$, based on measured neutral hydrolysis rate constant at pH 7 and 25°C (Weintraub et al. 1986; quoted, Howard et al. 1991).

Biodegradation: aerobic $t_{1/2}(\text{aq.}) = 672\text{--}4320 \text{ h}$, based on unacclimated aqueous aerobic biodegradation screening test data (Bouwer & McCarty 1983; quoted, Howard et al. 1991);

anaerobic $t_{1/2}(\text{aq.}) = 48\text{--}360 \text{ h}$, based on anaerobic stream and pond water sediment die-away test data (Jafvert & Wolfe 1987; quoted, Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ for the reaction with OH radical in air (USEPA 1974; quoted, Darnall et al. 1976); photooxidation $t_{1/2} = 257\text{--}2567 \text{ h}$, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aqueous aerobic biodegradation (Howard et al. 1991); $k(\text{exptl}) \leq 0.014 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C , with $t_{1/2} \geq 28 \text{ d}$ at pH 7 (Yao & Haag 1991).

Ground water: $t_{1/2} = 470\text{--}2880 \text{ h}$, based on data from anaerobic ground water ecosystem study (Wilson et al. 1986; quoted, Howard et al. 1991) and data from an aerobic ground water ecosystem study (Swindoll et al. 1987; quoted, Howard et al. 1991).

Sediment: calculated $t_{1/2} = 1500 \text{ d}$ at 25°C and pH 7, based on studies in pure water and in barely saturated subsurface sediment at $25\text{--}60^\circ\text{C}$ (Haag & Mill 1988).

Soil: estimated $t_{1/2} \sim 3650 \text{ d}$ of volatilization loss from soil (Jury et al. 1990);

disappearance $t_{1/2} < 2.0 \text{ d}$, estimated from the volatilization loss of mixtures (Anderson et al. 1991);

$t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

TABLE 5.1.2.5.1

5.1.2.7 2-Bromopropane

Common Name: 2-Bromopropane

Synonym: isopropyl bromide

Chemical Name: 2-bromopropane, isopropyl bromide

CAS Registry No: 75-26-3

Molecular Formula: C_3H_7Br , $CH_3CHBrCH_3$

Molecular Weight: 122.992

Melting Point ($^{\circ}C$):

−89.0 (Dreisbach 1961; Horvath 1982; Dean 1985; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

59.50 (Dean 1985; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.3140, 1.3060 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961; Riddick et al. 1986)

Molar Volume (cm^3/mol):

93.6 ($20^{\circ}C$, Stephenson & Malanowski 1987)

97.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

30.16, 28.4 ($25^{\circ}C$, $58.6^{\circ}C$, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

4180, 3650, 3180, 3180 (0, 10, 20, $30^{\circ}C$, volumetric method, Rex 1906)

2877 (shake flask-volumetric method, Fühner 1924)

3198 ($30^{\circ}C$, shake flask, Van Arkel & Vles 1936)

3162 (Seidell 1940; quoted, Deno & Berkheimer 1960; Hine & Mookerjee 1975)

2880, 2690 ($20^{\circ}C$, Korenman et al. 1971)

3000 (selected exptl., Horvath 1982)

2900 ($18^{\circ}C$, Dean 1985)

2860 ($18^{\circ}C$, selected, Riddick et al. 1986)

4160, 3640, 3170, 3170 (0, 10, 20, $30^{\circ}C$, tentative values of IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

23380, 35220 ($20^{\circ}C$, $30^{\circ}C$, volumetric method Rex 1906)

26664 ($23.8^{\circ}C$, summary of literature data, temp range -61.8 to $60^{\circ}C$, Stull 1947)

31500 (calculated by formula, Dreisbach 1961)

$\log(P/mmHg) = 6.61405 - 1072.9/(228.0 + t/^{\circ}C)$; temp range -19 to $95^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log(P/mmHg) = [-0.2185 \times 7591.7/(T/K)] + 7.887729$; temp range -61.8 to $60^{\circ}C$ (Antoine eq., Weast 1972–73)

28780 (interpolated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.09819 - 1200.652/(233.815 + t/^{\circ}C)$; temp range 0 – $30^{\circ}C$ (Antoine eq. from reported exptl. data of Rex 1906, Boublik et al. 1984)

31500 (selected, Riddick et al. 1986)

$\log(P/kPa) = 5.92741 - 1106.82/(222.851 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

31940 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.28473 - 858.03/(-71.18 + T/K)$; temp range 236 – 328 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.91155 - 1098.573/(-51.268 + T/K)$; temp range 299 – 332 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$$\log (P/\text{mmHg}) = 31.3032 - 2.4924 \times 10^3/(T/K) - 8.4645 \cdot \log (T/K) + 1.6459 \times 10^{-10} \cdot (T/K) + 3.7859 \times 10^{-6} \cdot (T/K)^2;$$

temp range 184–532 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1107	(calculated- $1/K_{\text{AW}}$, $C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)
2479, 1564	(calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)
1082	(calculated-QSAR, Nirmalakhandan & Speece 1988)
978	(computed value, Yaws et al. 1991)
1192	(γ^∞ from gas stripping-GC, Li et al. 1993)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.90	(calculated- π const., Hansch et al. 1968)
2.14	(recommended, Hansch et al. 1995)
1.80	(calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis: $k = 3.86 \times 10^{-6} \text{ s}^{-1}$ with estimated $t_{1/2} \sim 2.0 \text{ d}$ at pH 7 and 25°C (Mabey & Mill 1978)

$k = 1.4 \times 10^{-2} \text{ h}^{-1}$ at pH 7 and 25°C with estimated $t_{1/2} \sim 2.0 \text{ d}$ (Mabey & Mill 1978; quoted, Schwarzenbach et al. 1985; Vogel & Reinhard 1986);

rate constants at 25°C : $k = (379 \pm 41) \times 10^{-8} \text{ s}^{-1}$ in distilled water at pH 3–11 for equal or more than 72% conversion (Mill et al. 1980; quoted, Haag & Mill 1988),

$k = (383 \pm 33) \times 10^{-8} \text{ s}^{-1}$ in distilled water for 89% conversion, $k = (372 \pm 64) \times 10^{-8} \text{ s}^{-1}$ in sediment-extracted water for 87% conversion, and $k = (420 \pm 80) \times 10^{-8} \text{ s}^{-1}$ in sediment pores at pH 7.3 for 88% conversion (Haag & Mill 1988).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

Surface water: estimated $t_{1/2} \sim 2.0 \text{ d}$ at pH 7 and 25°C based on hydrolysis rate constant (Mabey & Mill 1978)

Ground water:

Sediment: $t_{1/2} = 2.1 \text{ d}$, based on neutral and base-catalyzed hydrolysis studies at 25°C in pure water and in barely saturated subsurface sediment at $25\text{--}60^\circ\text{C}$ (Haag & Mill 1988).

Soil:

Biota:

5.1.2.8 1,2-Dibromopropane

Common Name: 1,2-Dibromopropane

Synonym: propylene bromide, propylene dibromide

Chemical Name: 1,2-dibromopropane

CAS Registry No: 78-75-1

Molecular Formula: $C_3H_6Br_2$, $CH_3CHBrCH_2Br$

Molecular Weight: 201.888

Melting Point ($^{\circ}C$):

−55.49 (Lide 2003)

Boiling Point ($^{\circ}C$):

141.0 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.93268, 1.92344 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959)

1.9324, 1.9241 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

10972 ($20^{\circ}C$, manometry, measured range 20 – $70^{\circ}C$, Smyth & Engel 1929)

5333 ($24.8^{\circ}C$, summary of literature data, measured range -33.0 to $101.6^{\circ}C$, Stull 1947)

5502 (calculated by formula, Dreisbach 1961)

$\log(P/mmHg) = 6.92254 - 1298.608/(219.70 + t/^{\circ}C)$; temp range 19 – $141^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = 6.92254 - 1298.608/(219.70 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log(P/mmHg) = [-0.2185 \times 8789.1/(T/K)] + 8.028836$; temp range -33.0 to $101.6^{\circ}C$ (Antoine eq., Weast 1972–73)

5502 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.04744 - 1298.608/(219.70 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

5502 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.04744 - 1298.608/(-53.45 + T/K)$; temp range 273 – 400 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.1388 - 1349.142/(-48.003 + T/K)$; temp range 338–373 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 74.7061 - 4.0663 \times 10^3/(T/K) - 25.61 \cdot \log (T/K) + 1.3166 \times 10^{-2} \cdot (T/K) + 1.421 \times 10^{-13} \cdot (T/K)^2$; temp range 161–577 K (vapor pressure eq., Yaws 1994)

5506 (static method-manometer, measured range 278.15–323.15 K, Garriga et al. 2002)

$\ln (P/\text{kPa}) = 14.12331 - 3088.751/[(T/K) - 49.418]$; temp range 278.15–323.15 K (static method, Garriga et al. 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25° C):

1242 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

1600, 2313 (calculated-group contribution method, calculated-bond contribution Hine & Mookerjee 1975)

964.4 (calculated-QSAR, Nirmalakhandan & Speece 1988)

1223 (computed value, Yaws et al. 1991)

1215 (γ^∞ from gas stripping-GC, Li et al. 1993)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.75 (generator column-GC, DeVoe et al. 1981; Wasik et al. 1981; Tewari et al. 1982)

2.75 (generator column-HPLC, DeVoe et al. 1981)

2.79 (estimated-activity coefficients, Wasik et al. 1981)

2.64 (estimated-activity coefficients, Schantz & Martire 1987)

2.75 (recommended, Sangster 1989)

2.75 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h for the reaction with OH radical in air (USEPA 1974; quoted, Darnall et al. 1976).

5.1.2.10 1-Bromopentane (*n*-Amyl bromide)

Common Name: 1-Bromopentane

Synonym: *n*-amyl bromide, monobromopentane, pentyl bromide

Chemical Name: *n*-amyl bromide, 1-bromopentane, monobromopentane, pentyl bromide

CAS Registry No: 110-53-2

Molecular Formula: C₅H₁₁Br, CH₃CH₂CH₂CH₂CH₂Br

Molecular Weight: 151.045

Melting Point (°C):

−88.0 (Lide 2003)

Boiling Point (°C):

129.8 (Lide 2003)

Density (g/cm³ at 20°C):

1.2182, 1.2119 (20°C, 25°C, Dreisbach 1961; Riddick et al. 1986)

Molar Volume (cm³/mol):

124.0 (20°C, calculated- density; Stephenson & Malanowski 1987)

141.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

41.78, 34.49 (25°C, at normal bp, Dreisbach 1961)

41.43, 34.49 (25°, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.46 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

127 (generator column-GC, Tewari et al. 1982)

141 (calculated-UNIFAC activity coeff., Arbuckle 1986)

127 (selected, Riddick et al. 1986)

127 (tentative value, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999b)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

1754 (calculated by formula, Dreisbach 1961)

log (P/mmHg) = 6.95580 − 1401.634/(214.38 + t/°C); temp range 41–171°C (Antoine eq. for liquid state, Dreisbach 1961)

log (P/mmHg) = 6.95580 − 1401.634/(214.38 + t/°C); pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

1680 (quoted, Riddick et al. 1986)

log (P/kPa) = 6.08070 − 11401.634/(214.38 + t/°C); temp range not specified (Antoine eq., Riddick et al. 1986)

1680 (interpolated-Antoine eq., Malanowski 1987)

log (P_l/kPa) = 6.0807 − 1401.634/(−58.77 + T/K); temp range 293–443 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m³/mol at 25°C):

2005 (computed value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, log K_{ow}:

3.37 (generator column-GC, DeVoe et al. 1981; Tewari et al. 1982)

3.37 (generator column-HPLC, DeVoe et al. 1981)

3.49 (generator column-GC, Wasik et al. 1981)

3.32 (estimated-measured activity coefficients, Schantz & Martire 1987)

3.37 (recommended, Sangster 1989)

3.37 (calculated-UNIFAC activity coeff., Dallos et al. 1993)

3.37 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h for the reaction with OH radicals in air (USEPA 1974; quoted, Darnall et al. 1976).

5.1.2.11 1-Bromohexane

Common Name: 1-Bromohexane

Synonym: *n*-hexyl bromide

Chemical Name: 1-bromohexane

CAS Registry No: 111-25-1

Molecular Formula: $C_6H_{13}Br$; $CH_3(CH_2)_4CH_2Br$

Molecular Weight: 165.071

Melting Point ($^{\circ}C$):

−83.7 (Lide 2003)

Boiling Point ($^{\circ}C$):

155.3 (Dreisbach 1961; Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3):

1.1744, 1.1667 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961)

1.1744 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

140.6 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

163.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

46.77, 37.07 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

25.75 (generator column-GC/FID, Tewari et al. 1982)

25.8 (tentative value, IUPAC-NIST Solubility Data Series, Hovrath & Getzen 1999b)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

520 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = 7.0023 - 1503.52/(209.5 + t/^{\circ}C)$; temp range 63 – $202^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = 7.0023 - 1503.52/(209.5 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log(P_L/kPa) = 6.1272 - 1503.52/(T/K - 63.65)$; temp range 333 – $456\ K$ (Antoine eq., liquid phase, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.80 (generator column-GC, Tewari et al. 1982)

4.58 (HPLC-RT correlation, Burkhard et al. 1985)

3.80; 3.804 (generator column-GC; calculated-activity coeff. γ , Schantz & Martire 1987)

3.80 (recommended, Sangster 1989, 1993; Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

5.1.2.12 1-Bromoheptane

Common Name: 1-Bromoheptane

Synonym: heptyl bromide

Chemical Name: 1-bromoheptane

CAS Registry No: 629-04-9

Molecular Formula: $C_7H_{15}Br$

Molecular Weight: 179.098

Melting Point ($^{\circ}C$):

-56.1 (Dreisbach 1961; Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

178.9 (Dreisbach 1961; Weast 1982–83; Lide 2003)

Density (g/cm^3):

1.140, 1.1347 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961)

1.140 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

157.1 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

186.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

51.83, 39.59 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.68 (generator column-GC/GID, Tewari et al. 1982; Miller et al. 1985)

6.68 (tentative value, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999b)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

163 (calculated-Antoine eq., Dreisbach 1961)

$\log(P/mmHg) = 7.0582 - 1603.71/(205.0 + t/^{\circ}C)$; temp range 82 – $228^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = 7.0582 - 1603.71/(205.0 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log(P_L/kPa) = 6.1831 - 1603.71/(T/K - 68.15)$; temp range 333–483 K (Antoine eq., liquid phase, Stephenson & Malanowski 1987)

$\log(P/mmHg) = 43.3327 - 4.0389 \times 10^3/(T/K) - 12.105 \cdot \log(T/K) - 1.5959 \times 10^{-10} \cdot (T/K) + 3.0522 \times 10^{-6} \cdot (T/K)^2$; temp range 217–651 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.36 (generator column-GC, Wasik et al. 1981; Tewari et al. 1982)

4.36; 4.44 (generator column-GC; calculated-activity coeff., Schantz & Mairtire 1987)

1.0399 ($20^{\circ}C$, Weast 1982-83)

Molar Volume (cm^3/mol):

240.1 ($20^{\circ}C$, Stephenson & Malanowski 1987)

297.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

77.38, 50.91 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 7.3390 - 2061.93/(186.6 + t/^{\circ}C)$; temp range 165-237 $^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log(P/mmHg) = 7.3390 - 2061.93/(186.6 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini. 1961)

$\log(P/kPa) = 6.4639 - 2061.93/(T/K - 86.55)$; temp range 411-610 K (Antoine eq., liquid phase, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.98; 6.90 (HPLC-RT correlation; calculated-CLOPG, Burkhard et al. 1985)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

5.1.2.16 Bromocyclohexane

Common Name: Bromocyclohexane

Synonym: cyclohexyl bromide

Chemical Name: bromocyclohexane

CAS Registry No: 108-85-0

Molecular Formula: $C_6H_{11}Br$

Molecular Weight: 163.055

Melting Point ($^{\circ}C$):

-56.5 (Weast 1982-83; Lide 2003)

Boiling Point ($^{\circ}C$):

166.2 (Weast 1982-83; Lide 2003)

Density (g/cm^3):

1.33585, 1.32976 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

1.3359 ($20^{\circ}C$, Weast 1982-83)

Molar Volume (cm^3/mol):

122.06, 122.6 ($20^{\circ}C$, $25^{\circ}C$, calculated-density)

141.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

37.59, 44.80 (normal bp, $25^{\circ}C$, Dreisbach 1955)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

8.70 (Dreisbach 1955)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

421 (calculated by formula, Dreisbach 1955)

$\log (P/mmHg) = 6.97980 - 1572.19/(217.38 + t/^{\circ}C)$; temp range $68-260^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log P/mmHg = 6.97980 - 1572.19/(t/^{\circ}C + 217.38)$; temp range $68-200^{\circ}C$ (Antoine eq., Dean 1992)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.20 (shake flask-GC, Canton & Wagman 1983)

3.20 (recommended, Sangster 1993)

3.20 (selected, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

5.1.2.17 Vinyl bromide

Common Name: Vinyl bromide

Synonym: bromoethene, bromoethylene, ethylene bromide

Chemical Name: bromoethene

CAS Registry No: 593-60-2

Molecular Formula: C_2H_3Br , $CH_2 = CHBr$

Molecular Weight: 106.949

Melting Point ($^{\circ}C$):

-139.54 (Dreisbach 1959; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

15.80 (Dreisbach 1959; Dean 1985; Riddick et al. 1986; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.4933, 1.4738($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1959; Riddick et al. 1986)

1.4930 (Dean 1985)

Molar Volume (cm^3/mol):

71.6 ($20^{\circ}C$, calculated-density)

67.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

22.60, 23.45 ($25^{\circ}C$, bp, Dreisbach 1959; Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.121 (Dreisbach 1959; Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

4310 ($30^{\circ}C$, shake flask-interferometry, Saylor & Gross 1931)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

101325 ($15.8^{\circ}C$, summary of literature data, temp range -95.4 – $15.8^{\circ}C$, Stull 1947)

137700 (calculated-Antoine eq., Dreisbach 1959)

$\log(P/mmHg) = 6.66715 - 953.4/(236.0 + t/^{\circ}C)$; temp range -60 to $60^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1959)

145350 (extrapolated-Antoine eq., Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 6076.9/(T/K)] + 7.490979$; temp range -95.4 to $15.8^{\circ}C$ (Antoine eq., Weast 1972–73)

144330, 139840 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 7.03256 - 1494.17/(281.722 + t/^{\circ}C)$; temp range -66 – $11.9^{\circ}C$ (Antoine eq. derived from exptl data of Mehl 1934, Boublik et al. 1984)

$\log(P/kPa) = 6.08611 - 1083.017/(249.845 + t/^{\circ}C)$; temp range -87.5 – $16.0^{\circ}C$ (Antoine eq. derived from exptl data of Guyer et al. 1937, Boublik et al. 1984)

137700 (selected lit. value, Riddick et al. 1986)

$\log(P/kPa) = 5.79205 - 953.4/(236.0 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

140480 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.03266 - 1014.0/(-37.15 + T/K)$; temp range 224–319 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = -10.9281 - 1.1619 \times 10^3/(T/K) + 9.3115 \cdot \log(T/K) - 2.2655 \times 10^{-2} \cdot (T/K) - 4.531 \times 10^{-5} \cdot (T/K)^2$; temp range 135–473 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$):

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 1.57 (shake flask, Log P Database, Hansch & Leo 1987; recommended, Hansch et al. 1995)
- 1.57 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} = 6.81 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 25.4°C (Perry et al. 1977)

$k_{\text{OH}}(\text{calc}) = 6.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 6.81 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR [structure-activity relationship], Atkinson 1985)

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320 \text{ h}$, based on aqueous screening test data for vinyl chloride (Heffgott et al. 1977; Freitag et al. 1984; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2880\text{--}17280 \text{ h}$, based on estimated unacclimated aqueous aerobic half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 0.24\text{--}2.4 \text{ h}$ from air for the reaction with OH radicals (USEPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 9.4\text{--}94 \text{ h}$, based on measured rate constant for reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}69000 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991) and an estimated half-life for anaerobic biodegradation of vinyl chloride from a ground water field study of chlorinated ethenes (Silka & Wallen 1988; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.3 IODOALKANES

5.1.3.1 Iodomethane (Methyl iodide)

Common Name: Methyl iodide

Synonym: iodomethane, moniodomethane

Chemical Name: methyl iodide

CAS Registry No: 74-88-4

Molecular Formula: CH₃I

Molecular Weight: 141.949

Melting Point (°C):

-66.4 (Lide 2003)

Boiling Point (°C):

42.43 (Lide 2003)

Density (g/cm³ at 20°C):

2.2790, 2.265 (20°C, 25°C, Dreisbach 1961)

2.2792, 2.265 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

62.28 (20°C, calculated-density)

62.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

27.97, 27.338 (25°C, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

14190* (20°C, volumetric method, measured range 0–30°C, Rex 1906)

13630 (20°C, Merckel 1937)

14200 (Seidell 1940; Seidell 1941)

log [C/(mol/L)] = -110.278 + 37.621·log (T/K) + 4823/(T/K); temp range 278.16–322.91 K (Glew & Moelwyn-Hughes 1953)

13900* (recommended, temp range 0–40°C, Horvath 1982)

14000 (20°C, Verschueren 1983; Riddick et al. 1986)

14000 (Dean 1985)

Vapor Pressure (Pa at 25°C, or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

44180, 64440(20°C, 30°C, Rex 1906)

75860* (34.4°C, temp range 0.10–34.4°C, Thompson & Linnett 1936)

53329* (25.3°C, summary of literature data, temp range -55.0 to 25.3°C, Stull 1947)

log (P/mmHg) = 22.974 - 5.346·log (T/K) - 2132/(T/K); temp range 278.16–322.91 K (Glew & Moelwyn-Hughes 1953)

54120 (calculated-Antoine eq., Dreisbach 1961)

log (P/mmHg) = 6.87991 - 1093.235/(230.94 + t/°C); temp range -29 to 76°C (Antoine eq. for liquid state, Dreisbach 1961)

log (P/mmHg) = 6.87991 - 1093.235/(230.94 + t/°C); pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

49704* (22.879°C, temp range -13.819 to 41.427°C, Boublik & Aim 1972; quoted, Boublik et al. 1984)

47750 (interpolated-Antoine eq., Weast 1972–73)

$\log (P/\text{mmHg}) = [-0.2185 \times 6616.5/(T/K)] + 7.403018$; temp range -55.0 to 254.8°C (Antoine eq., Weast 1972–73)

53980 (calculated-Antoine eq., Kudchadker et al. 1979)

$\log (P/\text{mmHg}) = 6.97241 - 1138.29/(t/^\circ\text{C} + 235.774)$; temp range -14 to 42°C (Antoine eq., Kudchadker et al. 1979)

54120 (lit. average, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.09731 - 1138.29/(235.774 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

53960 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.10541 - 1142.67/(-36.87 + T/K)$; temp range 228 – 337 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = A6.17197 - 1240.17/(-17.887 + T/K)$; temp range 315 – 502 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -20.3718 - 1.2536 \times 10^3/(T/K) + 13.645 \cdot \log (T/K) - 2.6955 \times 10^{-2} \cdot (T/K) + 1.6389 \times 10^{-5} \cdot (T/K)^2$; temp range 207 – 528 K (vapor pressure eq., Yaws 1994)

54009 (selected summary of literature data, temp range 206.71 – 363.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

541*, 536 (exptl.-concn ratio, measured range 0 – 49°C , calculated-P/C, Glew & Moelwyn-Hughes 1953)

$\log \{H/(\text{mmHg} \cdot \text{L/mol})\} = 133.252 - 42.967 \cdot \log (T/K) - 6955.2/(T/K)$; temp range 273.16 – 322.91 K (Glew & Moelwyn-Hughes 1953)

653* (29.43°C , concn ratio, measured range 29.43 – 40.34°C , Swain & Thornton 1962)

554.9 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

$\ln K_{AW} = 10.34 - 3541/(T/K)$; measured range 5 – 33°C (distilled water, multiply equilibrium-GC, Hunter-Smith 1983)

287 (computed value, Yaws et al. 1991)

159, 442 (0 , 20°C , distilled water, headspace-GC, Elliott & Rowland 1993)

429 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 1996)

414 (20°C , selected from reported experimental determined values, Staudinger & Roberts 2001)

$\log K_{AW} = 4.059 - 1416/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.69 (19°C , shake flask, Collander 1951)

1.51 (shake flask-GC, Hansch et al. 1975; Hansch & Leo 1979)

1.51 (recommended, Sangster 1989)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C :

2.16 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 535$ – 5348 h, based on a measured rate constant for the vapor phase reaction with hydroxyl radical in air (Garraway & Donovan 1979; quoted, Howard et al. 1991).

Hydrolysis: $k = 7.28 \times 10^{-8} \text{ s}^{-1}$ at pH 7 (extrapolated to 25°C) with $t_{1/2} = 110$ d (Mabey & Mill 1978).

Biodegradation: aqueous aerobic $t_{1/2} = 1168$ – 672 h, based on estimated aerobic half-life (Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672$ – 2688 h, based on estimated aerobic half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976); $t_{1/2} = 535\text{--}5348$ h, based on a measured rate constant for the vapor phase reaction with hydroxyl radical in air (Garraway & Donovan 1979; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 168\text{--}672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 336\text{--}1344$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168\text{--}672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

FIGURE 5.1.3.1.3 Logarithm of Henry's law constant versus reciprocal temperature for iodomethane.

5.1.3.2 Iodoethane (Ethyl iodide)

Common Name: Ethyl iodide

Synonym: iodoethane

Chemical Name: ethyl iodide, iodoethane,

CAS Registry No: 75-03-6

Molecular Formula: C_2H_5I , CH_3CH_2I

Molecular Weight: 155.965

Melting Point ($^{\circ}C$):

-111.1 (Dreisbach 1961; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

72.30 (Rex 1906; Dreisbach 1961; Horvath 1982; Riddick et al. 1986; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.9358, 1.9245 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961)

1.9357, 1.9244 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

80.6 ($20^{\circ}C$, calculated from density)

85.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

31.93, 29.77 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

4030* ($20^{\circ}C$, volumetric method, measured range $0-30^{\circ}C$, Rex 1906;)

3910 ($22.5^{\circ}C$, volumetric method, Fühner 1924)

4040 ($30^{\circ}C$, shake flask-interferometry, Gross & Saylor 1931)

4040 ($30^{\circ}C$, shake flask, Van Arkel & Vles 1936)

3915 ($20^{\circ}C$, Merckel 1937)

3918 (Seidell 1940, 1941; quoted, Deno & Berkheimer 1960; Hansch et al. 1968; Hine & Mookerjee 1975)

3915 ($22.5^{\circ}C$, Saracco & Spaccamela Marchetti 1958)

3920 ($20^{\circ}C$, exptl., Korenman et al. 1971)

4041* (summary of literature data temp range $0-30^{\circ}C$, Horvath 1982)

3880 ($30^{\circ}C$, selected, Riddick et al. 1986)

4000* (tentative value, temp range $0-30^{\circ}C$, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

$S/(wt\%) = 8.5757 - 5.5568 \times 10^{-2} \cdot (T/K) + 9.43918 \times 10^{-5} \cdot (T/K)^2$, temp range 273–303 K (eq. derived from literature solubility data, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

14280, 22150 ($20^{\circ}C$, $30^{\circ}C$, Rex 1906)

21678* ($30^{\circ}C$, manometry, measured range $30-60^{\circ}C$, Smyth & Engel 1929)

14612* ($20^{\circ}C$, temp range -19.36 to $20.4^{\circ}C$, Milazzo 1944)

13332* ($18^{\circ}C$, summary of literature data, temp range -54.4 to $72.4^{\circ}C$, Stull 1947)

18160 (calculated-Antoine eq., Dreisbach 1961)

$\log (P/mmHg) = 6.83198 - 1175.709/(225.26 + t/^{\circ}C)$; temp range -6 to $109^{\circ}C$, (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = 6.83198 - 1175.709/(225.26 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log (P/mmHg) = [-0.2185 \times 6843.1/(T/K)] + 7.635277$; temp range -74.3 to $229.5^{\circ}C$ (Antoine eq., Weast 1972–73)

$\log (P/\text{kPa}) = 7.12695 - 1823.148/(285.30 + t/^{\circ}\text{C})$; temp range -19.36 to 20.4°C (Antoine eq. derived from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.06765 - 1222.410/(228.368 + t/^{\circ}\text{C})$, temp range 30 – 60°C (Antoine eq. derived from reported experimental data, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 6.959 - 1232.0/(229.0 + t/^{\circ}\text{C})$; temp range 30 – 60°C (Antoine eq., Dean 1985, 1992)

$\log (P/\text{kPa}) = 5.95688 - 1175.709/(225.26 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986) 18430 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.95686 - 1175.709/(-47.89 + T/\text{K})$; temp range 249 – 369 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 31.4422 - 2.5719 \times 10^3/(T/\text{K}) - 8.4867 \cdot \log (T/\text{K}) - 9.0736 \times 10^{-11} \cdot (T/\text{K}) + 3.571 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 162 – 561 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

732 (calculated- $1/K_{\text{AW}}$, $C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)

840 (calculated-QSAR, Nirmalakhandan & Speece 1988)

545 (computed value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.00 (shake flask-GC, Fujita et al. 1964; Hansch et al. 1968; Leo et al. 1971)

2.00 (recommended, Sangster 1989, 1993)

2.00 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C :

2.59 (calculated-measured infinite dilution activity coeff. and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Hydrolysis: rate constant $k = 1.62 \times 10^{-7} \text{ s}^{-1}$ with $t_{1/2} = 49$ d at 25°C and pH 7 (Mabey & Mill 1978)

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4$ – 24 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

Surface water: $t_{1/2} = 49$ d at 25°C and pH 7 (Mabey & Mill 1978)

Ground water:

Sediment:

Soil:

Biota:

TABLE 5.1.3.2.1**Reported aqueous solubilities of 1-iodoethane at various temperatures**

$$S/(\text{wt}\%) = 0.4391 - 3.24498 \times 10^{-3} \cdot (t/^{\circ}\text{C}) + 4.49991 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 + 1.15001 \times 10^{-6} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$S/(\text{wt}\%) = 8.5757 - 5.5568 \times 10^{-2} \cdot (T/\text{K}) + 9.43918 \times 10^{-4} \cdot (T/\text{K})^2 \quad (2)$$

5.1.3.3 1-Iodopropane

Common Name: 1-Iodopropane

Synonym: monoiodopropane, *n*-propyl iodide, propyl iodide

Chemical Name: 1-iodopropane, monoiodopropane, *n*-propyl iodide, propyl iodide

CAS Registry No: 107-08-4

Molecular Formula: C₃H₇I, CH₃CH₂CH₂I

Molecular Weight: 169.992

Melting Point (°C):

−101.3 (Dreisbach 1961; Riddick et al. 1986; Lide 2003)

Boiling Point (°C):

102.5 (Lide 2003)

Density (g/cm³ at 20°C):

1.7489, 1.7394 (20°C, 25°C, Dreisbach 1961; Riddick et al. 1986)

Molar Volume (cm³/mol):

97.2 (20°C, calculated-density)

107.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

45.98, 31.70 (25°C, bp, Dreisbach 1961)

36.25 (25°C, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1070* (20°C, volumetric method, measured range 0–30°C, Rex 1906)

867 (20°C, volumetric method, Fühner 1924)

1040 (30°C, shake flask-interferometer, Gross & Saylor 1931)

1037 (30°C, shake flask, Van Arkel & Vles 1936)

Synonym: *n*-butyl iodide, moniodobutane

Chemical Name: *n*-butyl iodide, 1-iodobutane, moniodobutane

CAS Registry No: 542-69-8

Molecular Formula: C_4H_9I , $CH_3CH_2CH_2CH_2I$

Molecular Weight: 184.018

Melting Point ($^{\circ}C$):

−103.0 (Dreisbach 1961; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

130.53 (Dreisbach 1961; Riddick et al. 1986)

130.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.6154, 1.6072 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961; Riddick et al. 1986)

Molar Volume (cm^3/mol):

113.9, 114.5 ($20^{\circ}C$, $25^{\circ}C$, calculated- density, Riddick et al. 1986)

129.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

40.63, 33.40 ($25^{\circ}C$, bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

210 ($17.5^{\circ}C$, volumetric method, Fühner 1924)

202 ($20^{\circ}C$, Merckel 1937)

211 (Seidell 1940; quoted, Deno & Berkheimer 1960)

202 (Seidell 1941)

313 (Kakovsky 1957)

182 (selected exptl., Horvath 1982)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1848 (calculated-Antoine eq., Dreisbach 1961)

$\log (P/mmHg) = 6.82262 - 1358.860/(214.2 + t/^{\circ}C)$; temp range 40 – $174^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = 6.82262 - 1358.860/(214.20 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq., from correlation of selected lit. data, Li & Rossini 1961)

$\log (P/kPa) = 5.94752 - 1358.860/(214.20 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

1848 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 5.94752 - 1358.86/(-58.95 + T/K)$; temp range 292–431 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

1600 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

1426, 600 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

1331 (calculated-QSAR, Nirmalakhandan & Speece 1988)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.00 (calculated- π const., Hansch et al. 1968)

2.51 (calculated-fragment const. with correction factors in multiCASE program, Damborsky et al. 2001)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (US EPA 1974; quoted, Darnall et al. 1976).

5.1.3.6 1-Iodopentane

Common Name: 1-Iodopentane

Synonym: pentyl iodide

Chemical Name: 1-iodopentane

CAS Registry No: 628-17-1

Molecular Formula: $C_5H_{11}I$, $CH_3(CH_2)_3CH_2I$

Molecular Weight: 198.045

Melting Point ($^{\circ}C$):

-85.6 (Dreisbach 1961; Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

157 (Dreisbach 1961; Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3):

1.5061, 1.5088 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1961)

1.5161 ($20^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

130.6 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

151.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

43.33, 35.81 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

585 (calculated-Antoine eq., Dreisbach 1961)

$\log (P/mmHg) = 6.85172 - 1454.028/(209.17 + t/^{\circ}C)$; temp range 61 – $204^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1961)

$\log (P/mmHg) = 6.85172 - 1454.028/(209.17 + t/^{\circ}C)$; pressure range of 10 to 1500 mmHg (Antoine eq. from correlation of selected lit. data, Li & Rossini 1961)

$\log P_L/kPa = 5.97662 - 1454.028/(-63.98 + T/K)$; temp range 312–413 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

5.1.4 MIXED HALOGENATED HYDROCARBONS

5.1.4.1 Bromochloromethane

Common Name: Bromochloromethane

Synonym: chlorobromomethane, methylene bromochloride

Chemical Name: bromochloromethane, chlorobromomethane

CAS Registry No: 74-97-5

Molecular Formula: CH_2BrCl

Molecular Weight: 129.384

Melting Point ($^{\circ}\text{C}$):

-87.9 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

68.0 (Lide 2003)

Density (g/cm^3 at 20°C):

1.9344 (Dreisbach 1959; Weast 1982–83; Riddick et al. 1986)

1.9229 (25°C , Dreisbach 1959)

Molar Volume (cm^3/mol):

66.89 (20°C , calculated-density)

73.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

15000 (O'Connell 1963)

9000 (Kirk-Othmer 1964, Irmann 1965, Dean 1985)

15000 (Jolls 1966)

14778 (at saturated pressure, recommended, Horvath 1982)

16690 (generator column-GC, Tewari et al. 1982)

38900 (calculated-UNIFAC activity coeff., Arbuckle 1986)

17000 (selected, Riddick et al. 1986)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

18808 (24.06°C , ebulliometric method, measured range 15.72 – 68°C , McDonald et al. 1959)

$\log(P/\text{mmHg}) = 6.38587 - 895.556/(186.703 + t/^{\circ}\text{C})$; temp range 15.72 – 68.0°C (Antoine eq. from ebulliometric measurements, McDonald et al. 1959)

19620 (calculated-Antoine eq., Dreisbach 1959)

$\log(P/\text{mmHg}) = 6.86624 - 1132.3/(215.0 + t/^{\circ}\text{C})$; temp range -6 to 297°C (Antoine eq. for liquid state, Dreisbach 1959)

19520 (calculated-Antoine eq., Boublik et al. 1973)

$\log(P/\text{mmHg}) = 6.49606 - 942.267/(192.587 + t/^{\circ}\text{C})$; temp range 15.7 – 68°C (Antoine eq. from reported exptl. data of McDonald et al. 1959, Boublik et al. 1973)

19520 (calculated-Antoine eq., Kudchadker et al. 1979)

$\log(P/\text{mmHg}) = 6.41307 - 903.382/(187.594 + t/^{\circ}\text{C})$; temp range 16 – 68°C (Antoine eq., Kudchadker et al. 1979)

$\log(P/\text{kPa}) = 6.60056 - 932.609/(191.376 + t/^{\circ}\text{C})$; temp range 15.7 – 68°C (Antoine eq. from reported exptl. data of McDonald & Shrader 1959, Boublik et al. 1984)

19530 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.51146 - 891.345/(-86.965 + T/\text{K})$; temp range 226 – 341 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 2.7704 - 2.0139 \times 10^3/(T/K) + 3.7817 \cdot \log (T/K) - 1.3241 \times 10^{-2} \cdot (T/K) + 8.1979 \times 10^{-6} \cdot (T/K)^2$;
temp range 185–557 K (vapor pressure eq., Yaws 1994)
19257 (selected summary of literature data, temp range 185.21–368.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.41 (generator column-GC, Tewari et al. 1982)
1.41 (recommended, Sangster 1993)
1.41 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

rate constant for the reaction with OH: $k = (2.5 \pm 0.3) \times 10^{-6} \text{ M}^{-1} \text{ s}^{-1}$ was measured in 66.7% dioxane-water at 35.7°C (Hine et al. 1956; quoted, Roberts et al. 1992)

$k_{\text{OH}} = 1.11 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with atmospheric lifetime $\tau = 0.43 \text{ yr}$ at 298 K, measured range 277–377 K (flash photolysis resonance fluorescence and discharge flow electron paramagnetic resonance, Orkin et al. 1997)

Hydrolysis: rate constant $k = 1.2 \times 10^{-10} \text{ s}^{-1}$ with $t_{1/2} = 44 \text{ yr}$ at pH 7 and 25°C (Mabey & Mill 1978)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976)

Atmospheric lifetime $\tau = 0.21 \text{ yr}$ reduced from 0.43 yr due to reaction with OH with ocean removal (Orkin et al. 1997)

Surface water: hydrolysis rate constant $k = 1.2 \times 10^{-10} \text{ s}^{-1}$ with $t_{1/2} = 44 \text{ yr}$ at pH 7 and 25°C (Mabey & Mill 1978)

5.1.4.2 Bromodichloromethane

Common Name: Bromodichloromethane

Synonym: dichlorobromomethane

Chemical Name: bromodichloromethane, dichlorobromomethane

CAS Registry No: 75-27-4

Molecular Formula: CHBrCl_2

Molecular Weight: 163.829

Melting Point ($^{\circ}\text{C}$):

-57 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

90.0 (Weast 1977; Lide 2003)

Density (g/cm^3 at 20°C):

1.9710 (25°C , Verschueren 1983)

Molar Volume (cm^3/mol):

83.1 (20°C , calculated-density)

94.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C or as indicated):

4700 (22°C , Mabey et al. 1981)

2968 (30°C , headspace-GC, McNally & Grob 1984)

8880, 8668, 8506 ($20, 30, 40^{\circ}\text{C}$, infinite dilution activity coeff. γ -GC, Tse et al. 1992)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations):

6665 (20°C , Dreisbach 1952;)

8555, 13440, 20444 ($20, 30, 40^{\circ}\text{C}$, DIPPR compilation, Tse et al. 1992)

Henry's Law Constant (Pa m^3/mol at 25°C and reported temperature dependence equations):

244.2 (20°C , calculated-P/C, Mabey et al. 1982)

162 (20°C , batch air stripping-GC, Nicholson et al. 1984)

162, 152, 152 (20°C , batch stripping-GC, natural potable water samples, Nicholson et al. 1984)

$\ln [H/(\text{atm m}^3/\text{mol})] = 11.30 - 5210/(T/K)$; temp range 10 – 30°C (air stripping-GC measurements, Nicholson et al. 1984)

214.8 (gas stripping-GC, Warner et al. 1987)

243.1 (20 – 25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

243 (calculated-P/C, Mackay & Shiu 1990)

162, 263, 405 ($20, 30, 40^{\circ}\text{C}$, infinite dilution activity coeff. γ -GC, Tse et al. 1992)

55.2, 106, 192 ($0, 10, 20^{\circ}\text{C}$, seawater of salinity of 30.4‰, gas stripping-GC, Moore et al. 1995)

$\ln K_{\text{AW}} = 13.43 - 4678/(T/K)$; seawater of salinity of 30.4‰, temp range: 0 – 10°C (Moore et al. 1995)

185 (20°C , selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)

$\log K_{\text{AW}} = 6.143 - 2130/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

347 (37°C , equilibrium headspace-GC, Batterman et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.88 (calculated as per Tute 1971, Callahan et al. 1979; Mills et al. 1982)

2.10 (Hansch & Leo 1979)

2.10 (calculated, Mabey et al. 1982)

2.00 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$

2.98; 2.97 (equilibrium headspace-GC; calculated- K_{OW}/K_{AW} , Batterman et al. 2002)

Bioconcentration Factor, $\log BCF$:

1.544 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

0.72–1.37 (estimated as per Lyman et al. 1982, Howard 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

1.785 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

1.724–2.40 (estimated from S & K_{OW} , Swann et al. 1983; quoted, Howard 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: typical $t_{1/2}$ ~35 h for a range of 33 min to 12 d was estimated from experimentally determined gas transfer rates (Kaczmar et al. 1984; quoted, Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

calculated rate constants at 25°C: $k < 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 0.2 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982).

Hydrolysis: first-order rate constant $k = 1.6 \times 10^{-10} \text{ s}^{-1}$ at pH 7 and 25°C with a maximum $t_{1/2} = 137 \text{ yr}$ (Mabey & Mill 1978; quoted, Mabey et al. 1982; Howard 1990).

Biodegradation:

Biotransformation: estimated rate constant $k = 1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24 \text{ h}$ from air for the reaction with OH radical (Darnall et al. 1976);

$t_{1/2} = 3.92 \text{ months}$, based on an estimated rate constant $k = 8.522 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the vapor phase reaction with hydroxyl radical (GEMS 1987; quoted, Howard 1990).

Surface water: hydrolysis rate constant $k = 1.6 \times 10^{-10} \text{ s}^{-1}$ with $t_{1/2} = 137 \text{ yr}$ at pH 7 and 25°C (Mabey & Mill 1978)

5.1.4.3 Dibromochloromethane

Common Name: Dibromochloromethane

Synonym: chlorodibromomethane

Chemical Name: dibromochloromethane, chlorodibromomethane

CAS Registry No: 124-48-1

Molecular Formula: CHBr_2Cl

Molecular Weight: 208.280

Melting Point ($^{\circ}\text{C}$):

−22.0 (Dean 1985)

−20 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

119–120 (Weast 1977; Weast 1982–83)

120 (Lide 2003)

Density (g/cm^3 at 20°C):

2.451 (Weast 1982–83; Dean 1985)

Molar Volume (cm^3/mol):

84.98 (20°C , calculated-density)

97.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

4000 (calculated- K_{OW} , Mabey et al. 1982)

5814, 6000, 6102 (20, 30, 40°C , infinite dilution activity coeff. γ -GC, Tse et al. 1992)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

10131 (20°C , extrapolated-Antoine eq., Mabey et al. 1982)

2000 (20°C , selected, Mills et al. 1982)

6667 (20°C , Warner et al. 1987)

2324, 3877, 6232 (20, 30, 40°C , DIPPR compilation, Tse et al. 1992)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

100 (20°C , calculated-P/C, Mabey et al. 1982)

88.2; 88.1, 85.1 (20°C , batch air stripping-GC; quoted lit. values, Nicholson et al. 1984)

86.1, 81.06, 78.02 (20°C , batch stripping-GC, natural potable water samples, Nicholson et al. 1984)

$\ln [H/(\text{atm m}^3/\text{mol})] = 10.70 - 5210/(T/K)$; temp range 10 – 30°C (air stripping-GC measurements, Nicholson et al. 1984)

80.4 (gas stripping-GC, Warner et al. 1987)

120* (EPICS-GC/FID, measured range 10 – 30°C , Ashworth et al. 1988)

$\ln [H/(\text{atm}\cdot\text{m}^3/\text{mol})] = 14.62 - 6373/(T/K)$; temp range 10 – 30°C , (EPICS measurements, Ashworth et al. 1988)

100 (20 – 25°C and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

81.06, 142, 223 (20, 30, 40°C , infinite dilution activity coeff. γ -GC, Tse et al. 1992)

28.2, 56.3, 103 (0, 10, 20°C , seawater of salinity of 30.4‰, gas stripping-GC, Moore et al. 1995)

$\ln K_{\text{AW}} = 13.62 - 4914/(T/K)$; seawater of salinity of 30.4‰, temp range: 0 – 10°C (Moore et al. 1995)

85.3 (20°C , selected from reported experimental determined values, Staudinger & Roberts 1996, 2001)

$\log K_{\text{AW}} = 6.296 - 2273/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

218 (37°C , equilibrium headspace-GC, Batterman et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 2.09 (calculated as per Tute 1971, Callahan et al. 1979)
- 2.24 (Hansch & Leo 1979)
- 2.24 (calculated, Mabey et al. 1982)
- 2.16 (recommended, Sangster 1993)
- 2.04 (infinite dilution activity coeff.-GC, Tse & Sandler 1994)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 3.59 (calculated-measured infinite dilution activity coeff. and vapor pressure P, Abraham et al. 2001)
- 3.33; 3.31 (equilibrium headspace-GC; calculated- K_{OW}/K_{AW} , Batterman et al. 2002)

Bioconcentration Factor, $\log BCF$:Sorption Partition Coefficient, $\log K_{OC}$:Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: calculated $t_{1/2} = 43$ min to 16.6 d (using Langbein & Durum 1967 published O_2 re-aeration values) and $t_{1/2} = 45.9$ h both from rivers and streams (Kaczmar et al. 1984).

Photolysis:

Oxidation: calculated rate constants at 25°C: $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k = 0.5 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radicals (Mabey et al. 1982);

photooxidation $t_{1/2} = 1025\text{--}10252$ h, based on estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: rate constant $k = 8.0 \times 10^{-11} \text{ s}^{-1}$ with hydrolytic $t_{1/2} = 274$ yr at pH 7 and 25°C (Mabey & Mill 1978; quoted, Callahan et al. 1979; Howard et al. 1991);

$k = 2.88 \times 10^{-8} \text{ h}^{-1}$ at pH 7 and 25°C (analogy to chloroform as per Mabey & Mill 1978, Mabey et al. 1982).

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320$ h, based on aerobic screening test data (Tabak et al. 1981; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672\text{--}4320$ h, based on unacclimated anaerobic screening test data (Bouwer & McCarty 1983; Bouwer et al. 1981; quoted, Howard et al. 1991).

Biotransformation: estimated rate constant $k = 1.0 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacteria (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} = 2.4\text{--}24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976); $t_{1/2} = 1025\text{--}10252$ h, based on estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 274$ yr at pH 7 and 25°C based on hydrolysis rate constant (Mabey & Mill 1978)

$t_{1/2} = 672\text{--}4320$ h, based on aerobic screening test data (Tabak et al. 1981; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 336\text{--}4320$ h, based on estimated aqueous aerobic and anaerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on aerobic screening test data (Tabak et al. 1981; quoted, Howard et al. 1991).

5.1.4.4 Chlorodifluoromethane (HCFC-22)

Common Name: Chlorodifluoromethane

Synonym: difluorochloromethane, Freon 22, CFC-22, CF-22

Chemical Name: chlorodifluoromethane

CAS Registry No: 75-45-6

Molecular Formula: CHClF_2

Molecular Weight: 86.469

Melting Point ($^{\circ}\text{C}$):

−157.42 (Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

−40.7 (Lide 2003)

Density (g/cm^3 at 20°C):

1.2090 (21°C , Dean 1985)

1.1940 (25°C , Kirk-Othmer 1985)

1.2136, 1.1942 (20°C , 25°C , Riddick et al. 1986)

Molar Volume (cm^3/mol):

71.2 (20°C , calculated-density)

60.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

20.238 (bp, Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

4.123 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F:

Water Solubility (g/m^3 or mg/L at 25°C . Additional data at other temperatures designated * are compiled at the end of this section):

2800, 2900 (quoted values, Irmann 1965)

3000 (DuPont 1966, 1969; quoted, Horvath 1982; Riddick et al. 1986)

2930 (selected, Hine & Mookerjee 1975)

3000 (Weast 1976; quoted, Horvath 1982)

2899* (summary of literature data, temp range 0 – 60°C , Horvath 1982)

3000 (Dean 1985)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

101325* (-40.8°C , summary of literature data, temp range -122.8 to -40.8°C , Stull 1947)

1083100 (calculated-Antoine eq., Weast 1972–73)

$\log (P/\text{mmHg}) = [-0.2185 \times 5212.9/(T/\text{K})] + 7.730042$; temp range -122.8 to 85.3°C (Antoine eq., Weast 1972–73)

$\log (P/\text{mmHg}) = 6.93892 - 808.919/(t/^{\circ}\text{C} + 240.161)$; temp range -79 to -37°C (Antoine eq., Kudchadker et al. 1979)

1027400 (calculated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.0741 - 815.920/(241.369 + t/^{\circ}\text{C})$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

35120, 570500 (-61.26°C , 4.5°C , Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.06382 - 808.919/(240.161 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

1043900 (Interpolated-Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.33292 - 919.834/(-19.718 + T/\text{K})$; temp range 170 – 233 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.19138 - 863.436/(-26.04 + T/\text{K})$; temp range 230–275 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.35713 - 950.38/(-13.474 + T/\text{K})$; temp range 275–327 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.13064 - 1490.048/(64.627 + T/\text{K})$; temp range 324–366 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 40.3847 - 2.0731 \times 10^3/(T/\text{K}) - 12.317 \cdot \log (T/\text{K}) - 2.5116 \times 10^{-10} \cdot (T/\text{K}) + 1.0498 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 116–369 K (vapor pressure eq., Yaws 1994)

132020 (238.15 K, selected summary of literature data, temp range 15.74–238.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

$\log (H/\text{atm}) = 8.18 - 1469.55/(T/\text{K})$ (least-square regression of data from lit., Kavanaugh & Trussell 1980)

2980 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

2478.8 (calculated-QSAR, Nirmalakhandan & Speece 1988)

3058 (computed value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.08 (shake flask, Log P Database, Hansch & Leo 1987)

1.08 (recommended, Sangster 1993)

Bioconcentration Factor, $\log \text{BCF}$:

$\log(P/\text{kPa}) = 5.94591 - 839.622/(242.861 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

651040 (interpolated-Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log(P_1/\text{kPa}) = 5.94677 - 839.6/(-30.311 + T/\text{K})$; temp range 173-244 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_1/\text{kPa}) = 6.0058 - 860.828/(-28.11 + T/\text{K})$; temp range 173-240 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_1/\text{kPa}) = 5.92289 - 826.707/(-32.274 + T/\text{K})$; temp range 236-285 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log(P_1/\text{kPa}) = 6.30541 - 1035.857/(-1.496 + T/\text{K})$; temp range 282-345 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.51271 - 2016.711/(132.578 + T/\text{K})$; temp range 341–385 K (Antoine eq.-V, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 52.5701 - 2.2537 \times 10^3/(T/\text{K}) - 18.265 \cdot \log (T/\text{K}) + 1.298 \times 10^{-2} \cdot (T/\text{K}) + 2.0286 \times 10^{-13} \cdot (T/\text{K})^2$;
temp range 115–385 K (vapor pressure eq., Yaws 1994)

123390 (248.15 K, selected and summary of literature data, temp range 115.16–249.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated):

151960 (calculated-P/C, Mackay & Wolkoff 1973; quoted, Roberts & Dändliker 1983)

43080 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

22800 (estimated, Roberts 1984)

28704 (19.93°C, equilibrium cell-GC, measured range 0–40°C, Warner & Weiss 1985)

$\log K_{AW} = 5.811 - 1399/(T/\text{K})$; temp range: 10–30°C (EPICS-GC measurements, Munz & Roberts 1987)

304000 (20–25°C and low ionic strength, quoted, Pankow & Rosen 1988; Pankow 1990)

39557 (computed value, Yaws et al. 1991)

26566 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)

26810 (20°C, selected from reported experimental determined values, Staudinger & Roberts 2001)

$\log K_{AW} = 5.739 - 1380/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.16 (shake flask-GC, Hansch et al. 1975)

2.21 (calculated-fragment const., Rekker & de Kort 1979)

2.16 (recommended, Sangster 1993)

2.16 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

2.05 (soil, selected, Jury et al. 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: half-life of about few minutes (Mills et al. 1982); loss half-lives in marine mesocosm were estimated to be 20 d in spring at 8–16°C and $t_{1/2} = 13$ d in winter at 3–7°C (Wakeham et al. 1983).

Photolysis: photolytic dissociation of atmospheric CFCl_3 and CF_2Cl_2 gives chlorine atoms which destroys the ozone layer, these halomethanes may remain at altitudes of 20–40 km for 40–150 yr and will reach saturation values of 10–30 times the present levels (Molina & Rowland 1974).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}^* < 0.1 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 297.3 K, measured range 297–423.8 K (flash photolysis-RF, Atkinson et al. 1975)

$k_{OH} < 0.4 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow-LMR, Howard & Evenson 1976a)

$k_{OH} < 0.012 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (relative rate method, Cox et al. 1976)

photooxidation $t_{1/2} = 2118\text{--}21180$ h in air, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991)

$k_{OH} < 4 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Atkinson 1985)

$k_{OH} < 4 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with estimated tropospheric lifetime of > 50 yr for a global average concentration of OH radical (Bunce et al. 1991).

$k_{OH} < 1 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320$ h, based on acclimated aerobic screening test data for trichlorofluoromethane (Tabak et al. 1981; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688\text{--}16128$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} > 10$ d from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976); residence time of about 50 yr in N. troposphere, estimated by one-compartment nonsteady state model (Singh et al. 1978) and

residence time of 60–70 yr by two-compartment nonsteady state model (Singh et al. 1979);

estimated residence time in troposphere about 1 year (Lyman 1982);

$t_{1/2} = 2118\text{--}21180$ h, based on measured rate data for the vapor phase reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991);

estimated global average tropospheric lifetime $\tau > 50$ yr for the reaction with hydroxyl radical in air (Bunce et al. 1991).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: estimated $t_{1/2} \sim 10000$ d for volatilization loss from soil (Jury et al. 1990);

$t_{1/2} = 672\text{--}4320$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

5.1.4.6 Trichlorofluoromethane (CFC-11)

Common Name: Trichlorofluoromethane

Synonym: Arcton 11, fluorotrichloromethane, fluorocarbon-11, Freon-11, Frigen 11, R 11, CFC-11

Chemical Name: trichlorofluoromethane, fluorotrichloromethane

CAS Registry No: 75-69-4

Molecular Formula: CFCl_3

Molecular Weight: 137.368

Melting Point ($^{\circ}\text{C}$):

1080 (30°C , Horvath 1982)

1400 (Dean 1985)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

88550* (19.895°C , measured range -36.673 to 19.895°C , Osborne et al. 1941)

$\log(P/\text{mmHg}) = 18.54101 - 1841.72/(T/\text{K}) - 3.8423 \cdot \log(T/\text{K})$; temp range 236.487–296.822 K (static method-manometry, Osborne et al. 1941)

101325* (23.7°C , summary of literature data, temp range -84.3 to 23.7°C , Stull 1947)

95670 (calculated-Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 6424.1/(T/\text{K})] + 7.563786$; temp range -84.3 to 13.1°C (Antoine eq., Weast 1972–73)

88500 (20°C , Pearson & McConnell 1975)

106390 (Antoine eq., Reid et al. 1977)

106349 (20°C , calculated-Antoine eq., Kudchadker et al. 1979)

$\log(P/\text{mmHg}) = 6.89396 - 1074.04/(t/^{\circ}\text{C} + 237.276)$; temp range -37 to 20°C (Antoine eq., Kudchadker et al. 1979)

91580 (20°C , Verschueren 1983)

$\log(P/\text{kPa}) = 6.01333 - 1044.954/(237.102 + t/^{\circ}\text{C})$; temp range -36.67 to 19.89°C (Antoine eq. derived from exptl data of Osborne et al. 1941, Boublik et al. 1984)

107010 (Daubert & Danner 1985)

102200 (selected, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.01886 - 1047.04/(237.276 + t/^{\circ}\text{C})$; temp range not specified (Antoine eq., Riddick et al. 1986)

106340 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.99210 - 1032.23/(-37.85 + T/\text{K})$; temp range 213–249 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.99652 - 1034.048/(-37.672 + T/\text{K})$; temp range 213–301 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.03083 - 1053.874/(-34.955 + T/\text{K})$; temp range 295–363 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.36472 - 1285.088/(-0.653 + T/\text{K})$; temp range 357–429 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.75501 - 2744.806/(196.225 + T/\text{K})$; temp range 424–486 K (Antoine eq.-V, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 44.0884 - 2.5022 \times 10^3/(T/\text{K}) - 14.193 \cdot \log (T/\text{K}) + 7.8086 \times 10^{-3} \cdot (T/\text{K}) + 1.3769 \times 10^{-13} \cdot (T/\text{K})^2$; temp range 162–471 K (vapor pressure eq., Yaws 1994)

10640 (selected summary of literature data, temp range 162.05–313.15 K, Xiang 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

81200 (20°C , Pearson & McConnell 1975)

11650 (calculated-P/C, Neely 1976)

11050 (20°C , calculated-P/C, Mackay & Shiu 1981)

11044 (20°C , calculated-P/C, Mabey et al. 1982)

11754 (estimated-P/C, Lyman 1985)

$\ln K_{\text{AW}} = 9.25 - 2372/(T/\text{K})$; measured range $5\text{--}33^{\circ}\text{C}$ (distilled water, multiply equilibrium-GC, Hunter-Smith 1983)

$\ln K_{\text{AW}} = 10.50 - 2652/(T/\text{K})$; measured range $5\text{--}33^{\circ}\text{C}$ (seawater, multiply equilibrium-GC, Hunter-Smith 1983)

7925 (19.93°C , equilibrium cell-GC, measured range $0\text{--}40^{\circ}\text{C}$, Warner & Weiss 1985)

9827 (interpolated data of Warner & Weiss 1985; Howard 1990)

5907 (gas stripping-GC, Warner et al. 1987)

10234* (EPICS-GC/FID, measured range $10\text{--}30^{\circ}\text{C}$, Ashworth et al. 1988)

$\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 9.480 - 3513/(T/\text{K})$; temp range $10\text{--}30^{\circ}\text{C}$ (EPICS measurements, Ashworth et al. 1988)

11144 ($20\text{--}25^{\circ}\text{C}$ and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

12341 (computed value, Yaws et al. 1991)

8019 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 1996)

7824 (20°C , selected from reported experimental determined values, Staudinger & Roberts 2001)

$\log K_{\text{AW}} = 5.023 - 1324/(T/\text{K})$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.53 (shake flask-GC, Hansch et al. 1975; Hansch & Leo 1979)

2.53 (recommended, Sangster 1993)

2.53 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

1.92 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

1.95 (calculated, Klöpffer et al. 1982)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

2.20 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

2.31, 2.42, 2.16, 2.21 (estimated- K_{OW} , Karickhoff 1985)

2.13, 2.26 (estimated-S, Karickhoff 1985)

2.20 (best estimate, Karickhoff 1985)

2.13 (average from estimates of K_{OW} and S, Karickhoff 1985; quoted, Neely & Blau 1985)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 3.4$ h from Henry's law constant for a river 1.0 m deep with a 3 m/s wind and 1 m/s current (Lyman et al. 1982; Cadena et al. 1984; quoted, Howard 1990);
 $t_{1/2} \sim$ few minutes (Mills et al. 1982).

Photolysis: photolytic dissociation of atmospheric CFCl_3 and CF_2Cl_2 gives chlorine atoms which destroys the ozone layer, these halomethanes may remain at altitudes of 20–40 km for 40–150 yr and will reach saturation values of 10–30 times the present levels (Molina & Rowland 1974).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}^* < 0.1 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296.8 K, measured range 297–424 K (flash photolysis-resonance fluorescence, Atkinson et al. 1975)

$k_{\text{OH}} < 0.05 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 ± 2 K (discharge flow-LMR, Howard & Evenson 1976a)

$k_{\text{OH}} < 0.005 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (relative rate method, Cox et al. 1976)

$k_{\text{OH}} < 1.0 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis: estimated exptl. rate constant $k = 9.5 \times 10^{-7} \text{ d}^{-1}$, based on carbon tetrachloride (Neely 1985).

Biodegradation: aqueous aerobic $t_{1/2} = 4032$ –8640 h, based on acclimated aerobic screening test data (Tabak et al. 1981; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 16128$ –34560 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} > 10$ d from air for the reaction with OH radical (US EPA 1974; quoted, Darnall et al. 1976);
 estimated residence time about 1000 yr in troposphere for the reaction with OH radical (CEQ 1975);
 estimated residence time in N. troposphere about 15–20 yr by one-compartment nonsteady state model and
 40–45 yr in troposphere by two-compartment nonsteady state model (Singh et al. 1979);
 estimated residence time in troposphere about 1–6 yr (Lyman 1982);
 $t_{1/2} = 14.7$ –147 yr, based on an measured rate data for the vapor phase reaction with hydroxyl radical in air
 (Atkinson 1985; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 4032$ –8640 h, based on acclimated aerobic screening test data (Tabak et al. 1981; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 8640$ –17280 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 4320$ –8640 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

5.1.4.7 1,1,2-Trichloro-1,2,2-trifluoroethane (CFC-113)

Common Name: 1,1,2-Trichloro-1,2,2-trifluoroethane

Synonym: CFC-113, Freon 113, 1,2,2-trifluoro-1,1,2-trichloroethane

Chemical Name: 1,1,2-trichloro-1,2,2-trifluoroethane, Arklone

CAS Registry No: 76-13-1

Molecular Formula: $C_2Cl_3F_3$, $CClF_2CCl_2F$

Molecular Weight: 187.375

Melting Point ($^{\circ}C$):

−36.22 (Lide 2003)

Boiling Point ($^{\circ}C$):

47.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.5635 ($25^{\circ}C$, Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

119.8 ($20^{\circ}C$, calculated-density)

129.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$. Additional data at other temperatures designated * are compiled at the end of this section):

170 (DuPont 1966; quoted, Riddick et al. 1986)

170 (shake flask-GC, Rauws et al. 1973)

170 ($20^{\circ}C$, Jones et al. 1977/1978)

166.4* (summary of literature data, Horvath 1982)

170 (Dean 1985)

170 (recommended, IUPAC-NIST Solubility Data Series, Horvath & Getzen 1999a)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

53329* ($30.2^{\circ}C$, summary of literature data, temp range -68.0 to $47.4^{\circ}C$, Stull 1947)

48476* (static method-isoteniscope, measured range 273.35 – 318.10 K, Hiraoka & Hildebrand 1963)

39040 (calculated-Antoine eq., Weast 1972–73)

48320 (calculated-Antoine eq., Boublik et al. 1984)

48480 (selected, Riddick et al. 1986)

$\log (P/kPa) = 6.6783 - 1499.2/(T/K)$, temp range not specified (Antoine eq., Riddick et al. 1986)

$\log (P_L/kPa) = 5.91657 - 1094.37/(-39.61 + T/K)$; temp range 273 – 319 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.01641 - 1115.812/(-42.515 + T/K)$; temp range 238 – 364 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.53093 - 1500.489/(12.469 + T/K)$; temp range 360 – 473 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 5.95163 - 1082.588/(-46.427 + T/K)$; temp range 297 – 317 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P/mmHg) = 33.7911 - 2.5323 \times 10^3/(T/K) - 9.3175 \cdot \log (T/K) + 1.455 \times 10^{-8} \cdot (T/K) + 2.914 \times 10^{-6} \cdot (T/K)^2$; temp range 238 – 481 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 32320* (EPICS-GC/FID, measured range $10\text{--}30^\circ\text{C}$, Ashworth et al. 1988)
 $\ln [H/(\text{atm m}^3/\text{mol})] = 9.649 - 3243/(T/K)$; temp range $10\text{--}30^\circ\text{C}$ (EPICS measurements, Ashworth et al. 1988)
 53300 (calculated-P/C, Howard 1990)
 49132 (computed value, Yaws et al. 1991)
 24616 (20°C , selected from reported experimental determined values, Staudinger & Roberts 2001)
 $\log K_{\text{AW}} = 5.375 - 1281/(T/K)$ (summary of literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 3.16 (HPLC- k' correlation, McDuffie 1981; quoted, Howard 1990, Sangster 1993))
 3.16 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

- 1.531, 1.041 (calculated-S, calculated- K_{OW} , Lyman et al. 1982; quoted, Howard 1990)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 2.28, 2.41 (soil, calculated- K_{OW} , calculated-S, Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: using Henry's law constant, $t_{1/2} = 4$ h was estimated for a model river 1 m deep flowing 1 m/s with wind velocity of 3 m/s (Lyman et al. 1982; quoted, Howard 1990).

Photolysis: both aqueous and atmospheric photolysis half-lives are infinite (Howard et al. 1991).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} < 0.3 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (discharge flow-laser magnetic resonance, Howard & Enenson 1976b)

photooxidation $t_{1/2} = 40\text{--}1000$ yr in troposphere, based on measured rates with singlet oxygen (Davidson et al. 1978; Pitts Jr. et al. 1974; quoted, Howard et al. 1991).

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 4320\text{--}8640$ h, based on a relative resistance of completely halogenated aliphatics to biodegrade; aqueous anaerobic $t_{1/2} = 17280\text{--}34560$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

degradation rates in microcosms at 20°C : $k = 7.6 \times 10^{-3} \text{ d}^{-1}$ by control buffer with $t_{1/2} = 90$ d, $k = 9.1 \times 10^{-3} \text{ d}^{-1}$ by redox buffer with $t_{1/2} = 75$ d, $k = 1.2 \times 10^{-2} \text{ d}^{-1}$ by 1 mg/L redox-hematin with $t_{1/2} = 57$ d, $k = 1.6 \times 10^{-2} \text{ d}^{-1}$ by 2 mg/L redox-hematin with $t_{1/2} = 43$ d, $k = 9.9 \times 10^{-2} \text{ d}^{-1}$ by purged leachate with $t_{1/2} = 7$ d, and $k = 0.14 \text{ d}^{-1}$ by leachate with $t_{1/2} = 5$ d (Lesage et al. 1992).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} > 10$ d from air for the reaction with OH radicals (USEPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 40\text{--}1000$ yr in troposphere, based on measured rates with singlet oxygen (Davidson et al. 1978; Pitts Jr. et al. 1974; quoted, Howard et al. 1991);

$t_{1/2} = 20$ yr in troposphere (Dilling 1982; quoted, Howard 1990).

Surface water: $t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1440\text{--}17280$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 4320\text{--}8640$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

120 (DuPont 1966; quoted, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

6106 ($20^{\circ}C$, measured range 10 – $91.5^{\circ}C$, Hovorka & Geiger 1933)

7609 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 9.94341 - 4259.092/(444.991 + t/^{\circ}C)$, temp range 10 – $91.5^{\circ}C$ (Antoine eq. derived from exptl. data of Hovorka & Geiger 1933, Boublik et al. 1984)

8770 (selected, Riddick et al. 1986)

$\log(P/kPa) = 7.2972 - 1929.27/(T/K)$; temp range not specified (Antoine eq., Riddick et al. 1986)

$\log(P_s/kPa) = 6.50788 - 1526.24/(-28.93 + T/K)$; temp range 235 – 293 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.67780 - 1567.8/(-29.58 + T/K)$; temp range 301 – 365 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.97313 - 1239.993/(-53.468 + T/K)$; temp range 312 – 362 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = -38.1282 - 1.2604 \times 10^3/(T/K) + 23.347 \cdot \log(T/K) - 3.4436 \times 10^{-2} \cdot (T/K) + 1.7407 \times 10^{-5} \cdot (T/K)^2$; temp range 299 – 551 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

9869 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

248, 1426 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

161419 (computed value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.82 (shake flask, Log P Database, Hansch & Leo 1987)

3.73 (Howard 1990)

2.82 (recommended, Sangster 1993)

Bioconcentration Factor, log BCF:

1.62 (estimated-S, Lyman et al. 1982)

Sorption Partition Coefficient, log K_{oc} :

2.50 (soil, estimated-linear regression with S, Lyman et al. 1982; quoted, Howard 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: volatilization $t_{1/2} \sim 4.0$ h from a model river 1 m deep flowing 1 m/s with a wind velocity of 3 m/s, based on estimated Henry's law constant (estimated-P/C, Lyman et al. 1982; quoted, Howard 1990).

Photolysis: will not undergo direct photolysis in the troposphere (quoted, Howard 1990).

Oxidation: inert to react with photochemically produced radicals and ozone molecules (Dilling 1982; Atkinson 1985,1987; quoted, Howard 1990).

Hydrolysis: not an environmentally significant fate process (DuPont 1980; quoted, Howard 1990).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: by analogy to other Freon compounds, Freon-112 is predicted to have a stratospheric lifetime on the order of several decades (Chou et al. 1978; quoted, Howard 1990).

Surface water: will volatilize very rapidly (estimated-P/C, Lyman et al. 1982; quoted, Howard 1990).

Ground water: will volatilize very rapidly (estimated-P/C, Lyman et al. 1982; quoted, Howard 1990).

Sediment: will volatilize very rapidly from soil surfaces (estimated-P/C, Lyman et al. 1982; quoted, Howard 1990).

Soil:

Biota:

5.1.5 FLUOROALKANES AND FLUOROALKENES

A large number of stable and volatile fluorinated and chlorinated alkanes and alkenes have been synthesized and used, primarily as refrigerants. These “freons” have been implicated as the cause of observed reductions in stratospheric ozone levels, thus permitting greater penetration of ultraviolet radiation to the Earth’s surface. Their high vapor pressures and relatively low solubilities in water result in high Henry’s law constants or air-water partition coefficients. Fate calculations show that when released into the environment virtually the total mass of these substances will partition to the atmospheric compartment. Levels in water, soil, sediments and biota are likely to be very low and of little concern. Accordingly, there is little merit in compiling detailed data on these substances in a format comparable to that, for example, the chlorobenzenes or PCBs.

In the interest of conserving space in this handbook, a compact tabular presentation format has been adopted. [Table 5.1.5.1](#) lists the chemical name, and its freon number (if applicable), molecular formula, molar weight and melting and boiling points. These data are available for virtually all substances in this group. Also shown in this table is the availability, expressed as a tick mark, of data on vapor pressure, solubility in water, octanol-water partition coefficient (K_{OW}) and the second order reaction rate constant with hydroxyl radicals. This rate constant is the critical determinant of persistence in the atmosphere. [Tables 5.1.5.2](#) to [Table 5.1.5.5](#) list the compounds and give the available property data with citations.

TABLE 5.1.5.1
Summary of physical constants for fluoroalkanes and fluoroalkenes

Compound	Freon no.	CAS no.	Molecular formula	Molecular weight g/mol	mp°C	bp°C	LeBas molar volume, V _M cm ³ /mol	Properties**

* Vapor pressure exceeds atmospheric pressure, Henry's law constant H (Pa·m³/mol) = 101325 Pa/C^S mol/m³.

TABLE 5.2.3

Suggested half-life classes of halogenated hydrocarbons in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Cycloalkanes and cycloalkenes:				
Dichloromethane	6	6	7	8
Trichloromethane	6	6	7	8
Tetrachloroethane	8	6	7	8
Chloroethane	6	6	7	8
1,2-Dichloroethane	6	6	7	8
1,1,2,2-Tetrachloroethane	8	6	7	8
Pentachloroethane	8	6	7	8
Hexachloroethane	8	6	7	8
1,2-Dichloropropane	5	6	7	8
1,2,3-Trichloropropane	5	6	7	8
Chloroethene (Vinyl chloride)	3	5	6	7
Trichloroethylene	4	6	7	8
Tetrachloroethylene	5	6	7	8
Chloroprene	3	5	6	7
Bromoalkanes and bromoalkenes:				
Tribromomethane	6	6	7	8
Mixed halogenated hydrocarbons:	5	5	6	7
Bromodichloromethane	5	5	6	7
Trichlorofluoromethane (CFC-11)	8	8	9	9
Class	Mean half-life (h)		Range (h)	
1	5		< 10	
2	17 (~ 1 d)		10–30	
3	55 (~ 2 d)		30–100	
4	170 (~ 1 week)		100–300	
5	550 (~ 3 weeks)		300–1,000	
6	1700 (~ 2 months)		1,000–3,000	
7	5500 (~ 8 months)		3,000–10,000	
8	17000 (~ 2 yr)		10,000–30,000	
9	55000 (~ 6 yr)		> 30,000

6 Chlorobenzenes and Other Halogenated Mononuclear Aromatics

CONTENTS

6.1	List of Chemicals and Data Compilations.	1259
6.1.1	Chlorobenzenes.	1259
6.1.1.1	Chlorobenzene.	1259
6.1.1.2	1,2-Dichlorobenzene.	1268
6.1.1.3	1,3-Dichlorobenzene.	1278
6.1.1.4	1,4-Dichlorobenzene.	1287
6.1.1.5	1,2,3-Trichlorobenzene.	1298
6.1.1.6	1,2,4-Trichlorobenzene.	1305
6.1.1.7	1,3,5-Trichlorobenzene.	1314
6.1.1.8	1,2,3,4-Tetrachlorobenzene.	1320
6.1.1.9	1,2,3,5-Tetrachlorobenzene.	1326
6.1.1.10	1,2,4,5-Tetrachlorobenzene.	1330
6.1.1.11	Pentachlorobenzene.	1335
6.1.1.12	Hexachlorobenzene.	1343
6.1.2	Chlorotoluenes.	1352
6.1.2.1	2-Chlorotoluene.	1352
6.1.2.2	3-Chlorotoluene.	1355
6.1.2.3	4-Chlorotoluene.	1357
6.1.2.4	2,4-Dichlorotoluene.	1360
6.1.2.5	2,6-Dichlorotoluene.	1362
6.1.2.6	3,4-Dichlorotoluene.	1364
6.1.2.7	2,3,6-Trichlorotoluene.	1365
6.1.2.8	2,4,5-Trichlorotoluene.	1366
6.1.2.9	α -Chlorotoluene.	1368
6.1.2.10	α,α,α -Trichlorotoluene.	1371
6.1.2.11	Pentachlorotoluene.	1373
6.1.2.12	<i>o</i> -Chlorostyrene.	1374
6.1.2.13	<i>m</i> -Chlorostyrene.	1375
6.1.2.14	<i>p</i> -Chlorostyrene.	1377
6.1.2.15	Octachlorostyrene.	1379
6.1.3	Fluorobenzenes.	1380
6.1.3.1	Fluorobenzene.	1380
6.1.3.2	1,2-Difluorobenzene.	1384
6.1.3.3	1,3-Difluorobenzene.	1386
6.1.3.4	1,4-Difluorobenzene.	1388
6.1.3.5	1,2,4-Trifluorobenzene.	1390
6.1.3.6	1,3,5-Trifluorobenzene.	1391
6.1.3.7	1,2,3,4-Tetrafluorobenzene.	1393

6.1.3.8	1,2,3,5-Tetrafluorobenzene	1395
6.1.3.9	1,2,4,5-Tetrafluorobenzene	1397
6.1.3.10	Pentafluorobenzene	1399
6.1.3.11	Hexafluorobenzene	1401
6.1.3.12	Pentafluorotoluene	1404
6.1.3.13	Chloropentafluorobenzene	1406
6.1.3.14	Pentafluorophenol	1408
6.1.4	Bromobenzenes and bromotoluenes	1410
6.1.4.1	Bromobenzene	1410
6.1.4.2	1,2-Dibromobenzene	1416
6.1.4.3	1,3-Dibromobenzene	1418
6.1.4.4	1,4-Dibromobenzene	1420
6.1.4.5	1,2,3-Tribromobenzene	1423
6.1.4.6	1,2,4-Tribromobenzene	1424
6.1.4.7	1,3,5-Tribromobenzene	1425
6.1.4.8	1,2,4,5-Tetrabromobenzene	1427
6.1.4.9	Hexabromobenzene	1429
6.1.4.10	2-Bromotoluene	1431
6.1.4.11	3-Bromotoluene	1433
6.1.4.12	4-Bromotoluene	1435
6.1.5	Iodobenzenes	1437
6.1.5.1	Iodobenzene	1437
6.1.5.2	1,2-Diiodobenzene	1441
6.1.5.3	1,3-Diiodobenzene	1442
6.1.5.4	1,4-Diiodobenzene	1443

6.1 LIST OF CHEMICALS AND DATA COMPILATIONS

6.1.1 CHLOROBENZENES

6.1.1.1 Chlorobenzene

Common Name: Chlorobenzene

Synonym: monochlorobenzene, benzene chloride, phenyl chloride

Chemical Name: chlorobenzene

CAS Registry No: 108-90-7

Molecular Formula: C_6H_5Cl

Molecular Weight: 112.557

Melting Point ($^{\circ}C$):

−45.31 (Lide 2003)

Boiling Point ($^{\circ}C$):

131.72 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1058 (Weast 1972–73; Lide 2003)

Molar Volume (cm^3/mol):

101.8 ($20^{\circ}C$, calculated-density)

116.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

9.49 (Dean 1985)

11.88 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

488 ($30^{\circ}C$, shake flask-interferometer, Gross & Saylor 1931)

551 (Landolt-Börnstein 1951)

488 (Seidell 1941)

< 200 (residue-volume method, Booth & Everson 1948)

500 (shake flask-UV, Andrews & Keefer 1950)

490* ($30^{\circ}C$, shake flask, Kisarov 1962)

546, 523; 534 ($21^{\circ}C$, generator column-GC; mean value, Chey & Calder 1972)

463 (shake flask-UV, Vesala 1974)

100 (Stephen & Stephen 1963)

106.8* (shake flask-GC, measured range $5-45^{\circ}C$, Nelson & Smit 1978)

472 (shake flask-GC, Aquan-Yuen et al. 1979)

472 (shake flask-GC, Mackay et al. 1979, 1980, 1982b)

503 (shake flask-UV, Yalkowsky et al. 1979)

420, 450* ($20^{\circ}C$; elution chromatography, UV adsorption, measured range $10-30^{\circ}C$, Schwarz & Miller 1980)

295 (generator column-HPLC/UV, Tewari et al. 1982)

498 (recommended, Horvath 1982)

499 (generator column-HPLC/UV, Wasik et al. 1983)

508 (HPLC- k' correlation, converted from reported γ_w , Hafkenscheid & Tomlinson 1983a)

295 (generator column-GC, Miller et al. 1984, 1985)

495* (recommended, temp range $10-70^{\circ}C$, IUPAC Solubility Data Series, Horvath & Getzen 1985)

$S/(\text{g/kg}) = 11.3351 - 3.0290 \times 10^{-2} \cdot (T/K) - 1.8716 \times 10^{-4} \cdot (T/K)^2 + 0.559466 \times 10^{-6} \cdot (T/K)^3$; temp range 283–363 K (regression of literature data, IUPAC Solubility Data Series, Horvath & Getzen 1985)

490 (30°C, quoted, Dean 1985)

502 (shake flask-HPLC/UV, Banerjee 1984)

348 (shake flask-radiometric method, Lo et al. 1986)

428 (vapor phase saturation-GC, temp range 15–45°C, Sanemasa et al. 1987)

482* (20°C vapor-liquid equilibrium-activity coefficient, measured range 20–50°C, Cooling et al. 1992)

477 (20°C, limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

333 (shake flask-GC, Boyd et al. 1998)

496 (solid-phase micro-extraction SPME-GC, Paschke et al. 1998)

$\ln x = -41.9062 + 6054.03/(T/K) + 1.3692 \times 10^{-4} \cdot (T/K)^2$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

470* (shake flask-GC, measured range 5–45°C, Ma et al. 2001)

426, 427, 511 (5, 15, 35°C, estimated-RP-HPLC- k' correlation, Finizio & Di Guardo 2001)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

1333* (22.2°C, summary of literature data, temp range –13.0 to 132.2°C, Stull 1947)

$\log(P/\text{mmHg}) = 7.18473 - 1556.6/(230 + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

$\log(P/\text{mmHg}) = 6.94504 - 1413.12/(216.0 + t/^\circ\text{C})$; temp range 40–200°C (Antoine eq. for liquid state, Dreisbach 1955)

7605* (56.28°C, ebulliometry, measured range 56.28–131.70°C, Dreisbach & Shrader 1949)

9657* (62.04°C, ebulliometry, measured range 62.04–131.7°C, Brown 1952)

1580 (interpolated-Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 10098.0/(T/K)] + 8.5000$; temp range –35 to –15°C (Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 9067.3/(T/K)] + 7.717535$; temp range –13 to 249.8°C (Antoine eq., Weast 1972–73)

1596, 1610 (extrapolated-Antoine eq., Boublik et al. 1973; 1984)

$\log(P/\text{kPa}) = 6.10416 - 1431.813/(217.655 + t/^\circ\text{C})$; temp range 62.04–131.7°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.07963 - 1419.045/(216.633 + t/^\circ\text{C})$; temp range 56.2–131.7°C (Antoine eq. from reported exptl. data of Derisbach & Shrader 1949, Boublik et al. 1984)

1586 (Daubert & Danner 1985)

1596 (extrapolated, Antoine eq., Dean 1985)

$\log(P/\text{mmHg}) = 6.97808 - 1431.05/(217.65 + t/^\circ\text{C})$; temp range 62–131.7°C (Antoine eq., Dean 1985, 1992)

1600 (extrapolated, Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.11512 - 1438.86/(-54.72 + T/K)$; temp range 333–405 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.62988 - 1897.41/(5.21 + T/K)$; temp range 405–597 K (Antoine eq.-II, Stephenson & Malanowski 1987)

1410* (gas saturation-GC, measured range –14.2 to 40°C, Liu & Dickhut 1994)

1828; 1560 (supercooled liquid P_L , GC-Kovács retention indices correlation; quoted lit., Spiessma et al. 1994)

$\log(P/\text{mmHg}) = 19.4343 - 2.5801 \times 10^3/(T/K) - 3.9391 \cdot \log(T/K) - 4.4005 \times 10^{-11} \cdot (T/K) + 4.9583 \times 10^{-7} \cdot (T/K)^2$; temp range 228–632 K (Yaws 1994)

$\log P/\text{kPa} = 6.11512 - 1438.86/(T/K - 54.72)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

451 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

441 (calculated-bond contribution, Hine & Mookerjee 1975)

382 (batch stripping-GC, Mackay et al. 1979)

379 (calculated P/C , Mackay et al. 1979)

330* (equilibrium cell-concentration ratio, measured range 1.0–23.0°C, Leighton & Calo 1981)

$\ln(k_H/\text{atm}) = 16.83 - 3466/(T/K)$; temp range 1.0–23.0°C (equilibrium cell-concn ratio, Leighton & Calo 1981)

314 (batch air stripping-GC, Mackay & Shiu 1981)

- 398 (gas stripping-GC, Warner et al. 1987)
 319 (20°C, EPICS-GC, Yurteri et al. 1987)
 273 (20°C, calculated-P/C, Yurteri et al. 1987)
 365* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm}\cdot\text{m}^3/\text{mol})] = 3.469 - 2689/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 460 (computer value, Yaws et al. 1991)
 324* (extrapolated from equilibrium headspace-GC data, measured range 45–80°C, Ettre et al. 1993)
 $\log (1/K_{\text{AW}}) = -2.9050240 + 1129.8083/(T/K)$; temp range 45–80°C (equilibrium headspace-GC measurements, Ettre et al. 1993)
 288 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 315 (gas stripping-GC, Shiu & Mackay 1997)
 293 (headspace equilibrium-GC, de Wolf & Lieder 1998)
 277.2 (exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)
 537 (modified EPICS method-GC, Ryu & Park 1999)
 297 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{\text{AW}} = 4.225 - 1507/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)
 384* (EPICS-SPME, measured range 2–60°C, Görgényi et al. 2002)
 $\ln K_{\text{AW}} = 10.04 - 3359.7/(T/K)$; temp range 2–60°C (EPICS-SPME method, Görgényi et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 2.84 (Fujita et al. 1964; Hansch et al. 1968; Leo et al. 1971; Hansch & Leo 1985)
 2.81 (calculated-fragment constant, Rekker 1977)
 2.18 (¹⁴C- LSC, Lu & Metcalf 1975)
 2.84, 2.46, 2.18 (Hansch & Leo 1979)
 2.79 (HPLC-RT correlation, Veith et al. 1979b)
 2.84 (HPLC- k' correlation, Könemann et al. 1979)
 2.80 (HPLC- k' correlation, Hanai et al. 1981)
 2.81 (HPLC- k' correlation, D'Amboise & Hanai 1982)
 2.83 (shake flask-HPLC, Hammers et al. 1982)
 2.18 (HPLC- k' correlation, Miyake & Terada 1982)
 2.80 (HPLC- k' correlation, Hafkenscheid & Tomlinson 1983a)
 2.98 (generator column-HPLC/UV, Wasik et al. 1983)
 2.98 (generator column-GC/ECD, Miller et al. 1984; 1985)
 2.81–2.84 (HPLC-RV correlation, Garst & Wilson 1984; Garst 1984)
 2.49 (HPLC- k' correlation, Haky & Young 1984)
 3.00 (HPLC- k' correlation, De Kock & Lord 1987)
 2.898 (slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 2.784 ± 0.061 , 2.898 ± 0.004 (shake flask methods, interlaboratory studies, Brooks et al. 1990)
 2.65, 2.73; 2.84 (25°C, 60°C, shake flask-UV/VIS; quoted lit. at 25°C, Kramer & Henze 1990)
 2.86, 3.02 (centrifugal partition chromatography, Gluck & Martin 1990)
 2.84 (recommended, Sangster 1993)
 2.89 (recommended, Hansch et al. 1995)
 2.98 (solid-phase micro-extraction SPME-GC, Paschke et al. 1998)
 2.96 (shake flask-dialysis tubing-HPLC/UV, both phases, Andersson & Schröder 1999)
 3.05* (estimated-RP-HPLC- k' correlation, measured range 5–35°C, Finizio & Di Guardo 2001)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 3.45* (20°C, HPLC- k' correlation, measured range 10–50°C, Su et al. 2002)
 $\log K_{\text{OA}} = 43910/(2.303\cdot\text{RT}) - 4.107$; temp range 10–50°C (HPLC- k' correlation, Su et al. 2002)

Bioconcentration Factor, $\log \text{BCF}$:

- 2.65 (fathead minnow, Veith et al. 1979b, 1980)
 1.30 (Kenaga 1980a)

- 1.08 (fish, flowing water, Kenaga & Goring 1980)
- 2.21 (microorganisms-water, Mabey et al. 1982)
- 1.70 (algae, Freitag et al. 1984, 1985; Halfon & Reggiani 1986)
- 1.88 (fish, Freitag et al. 1984; Halfon & Reggiani 1986)
- 3.23 (activated sludge, Freitag et al. 1984; Halfon & Reggiani 1986)
- 1.85 (fish, Freitag et al. 1985)
- 3.23 (activated sludge, Freitag et al. 1985)
- 1.93 (fish, calculated, Figueroa & Simmons 1991)

Sorption Partition Coefficient, log K_{OC} :

- 2.52 (sediment, Mabey et al. 1982)
- 2.18 (Kenaga 1980a)
- 2.59 (field data, Roberts et al. 1980; Schwarzenbach & Westall 1981; quoted, Voice & Weber 1985)
- 1.84 (river sediment, 0.56% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
- 1.73–2.99 (five soils, 0.04–0.73% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
- 2.44, 2.50 (calculated from K_{OW} , Schwarzenbach & Westall 1981)
- 2.73 (soil, calculated- K_{OW} , Calamari et al. 1983)
- 2.10 (calculated-MCI χ , Koch 1983)
- 2.92 (calculated- K_{OW} , Yoshida et al. 1983b)
- 2.60 (Offshore Grand Haven sediment, batch equilibrium-sorption isotherm, Voice & Weber, Jr. 1985)
- 2.44 (calculated-MCI χ , Bahnick & Doucette 1988)
- 1.92–2.59 (soil, Howard 1989)
- 2.50; 2.17 (Captina silt loam, OC 1.49%, pH 4.17; McLaurin sandy loam, OC 0.66%, pH 4.42, batch equilibrium-sorption isotherm, Walton et al. 1992)
- 2.34 (calculated-MCI χ , Sabljic et al. 1995)
- 2.19, 2.20 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
- 1.97, 2.14, 1.77 (soils: organic carbon OC $\geq 0.1\%$, OC $\geq 0.5\%$, $0.1 \leq OC < 0.5\%$, average, Delle Site 2001)

Sorption Partition Coefficient, log K_{OM} :

- 1.68 (Woodburn soil, organic matter 1.9%, batch equilibrium-sorption isotherm-GC/ECD, Chiou et al. 1983)
- 2.10, 2.32 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

- Volatilization: estimated $t_{1/2} \sim 1$ –12 h from a flowing stream (Cadena, 1984; selected, Howard 1989);
 $k = 0.033 \text{ d}^{-1}$ with $t_{1/2} = 21 \text{ d}$ in spring at 8–16°C, $k = 0.152 \text{ d}^{-1}$ with $t_{1/2} = 4.6 \text{ d}$ in summer at 20–22°C,
 $k = 0.053 \text{ d}^{-1}$ with $t_{1/2} = 13 \text{ d}$ in winter at 3–7°C for periods when volatilization appears to dominate, and
 $k = 0.08 \text{ d}^{-1}$ with $t_{1/2} = 8.9 \text{ d}$ with HgCl_2 in September 9–15, 1980 in marine mesocosm experiments;
estimated half-lives from soil: $t_{1/2} = 0.3 \text{ d}$ of 1-cm depth and $t_{1/2} = 12.6 \text{ d}$ for 10 cm depth (Wakeham et al. 1983).
- Photolysis: not environmentally significant or relevant (Mabey et al. 1982);
photolysis $k = 1.1 \times 10^{-5} \text{ d}^{-1}$ with an estimated $t_{1/2} \sim 170 \text{ yr}$ by sunlight in surface water at 40°N in the summer (Dulin et al. 1986)
 $t_{1/2} = 21 \text{ d}$ under sunlight in water (Mansour & Feicht 1994).
- Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:
photooxidation $t_{1/2} = 1553$ –62106 h in water, based on a measured rate for hydroxy radicals in aqueous solution (Dorfman & Adams 1973; Howard et al. 1991)
 $k_{OH} = 9.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 13 d, loss of 7.4% in one day or 12 sunlit hour at 300 K in urban environments (Singh et al. 1981)
 $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 radical (Mabey et al. 1982)
 $k = (0.75 \pm 0.2)3 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 1 mM propyl alcohol as scavenger at pH 2.0 and 20–23°C (Hoigné & Bader 1983)

$k = 2.88 \times 10^{-3} \text{ h}^{-1}$ in air (Yoshida et al. 1983b; selected, Mackay et al. 1985)

$k_{\text{OH}} = (8.8 \pm 1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with estimated atmospheric lifetime $\tau = 13 \text{ d}$ and $k_{\text{O}_3} < 5 \times 10^{-21} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with lifetime $\tau > 8.8 \text{ yr}$ at room temp. (relative rate method, Atkinson et al. 1985)

$k_{\text{OH}}(\text{obs.}) = 9.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; and $k_{\text{OH}}(\text{calc}) = 1.6 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{\text{OH}} = (5.5 \pm 4.4) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 23.5°C with an atmospheric lifetime $\tau = 21 \text{ d}$ (relative rate method, Edney et al. 1986)

$k_{\text{OH}} = 9.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 17 \text{ d}$ for reaction with OH radical, concn of $5.0 \times 10^5 \text{ molecule/cm}^3$ at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{calc}) = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs}) = 0.71 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}}^* = (7.41 \pm 0.94) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 234–438 K (flash photolysis-resonance fluorescence, Wallington et al. 1987)

$k_{\text{OH}} = 7.41 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 9.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988)

$k = (4.3\text{--}4.6) \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction of OH radical with benzene at pH 7 in aqueous solution (Kochany & Bolton 1992)

$k_{\text{OH}} = 7.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{\text{OH}}(\text{calc}) = 0.70 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis: not environmentally significant (Mabey et al. 1982);

base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ with $t_{1/2} > 900 \text{ yr}$, based on assumed base mediated 1% disappearance after 16 d at 85°C and pH 9.7 (Ellington et al. 1988).

$t_{1/2} > 879 \text{ yr}$ based on rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ extrapolated to pH 7 at 25°C from 1% disappearance after 16 d at 85°C and pH 9.7 (Ellington et al. 1988)

Biodegradation: significant degradation on anaerobic environment with $k = 0.5 \text{ d}^{-1}$ (Tabak et al. 1981; Mills et al. 1982)

$k = 1.88 \times 10^{-4} \text{ h}^{-1}$ in air, and $k = 3.83 \times 10^{-4} \text{ h}^{-1}$ in sediments (Lee & Ryan 1979; selected, Mackay et al. 1985)

$k = 0.24 \text{ L d}^{-1}$ in air, no degradation in water and on the ground (Neely 1982);

$k = 0.07\text{--}0.3 \text{ d}^{-1}$ in river water; $k = 0.04\text{--}0.2 \text{ d}^{-1}$ in estuary water; and $k = 0.01 \text{ d}^{-1}$ in marine water (Bartholomew & Pfaender 1983; selected, Battersby 1990)

$k = 0.033 \text{ d}^{-1}$, $t_{1/2} = 21 \text{ d}$ in spring at 8–16°C, $k = 0.152 \text{ d}^{-1}$, $t_{1/2} = 4.6 \text{ d}$ in summer at 20–22°C, $k = 0.053 \text{ d}^{-1}$, $t_{1/2} = 13 \text{ d}$ in winter at 3–7°C, and $k = 0.08 \text{ d}^{-1}$, $t_{1/2} = 8.9 \text{ d}$ with HgCl_2 in September 9–15, 1980 in marine mesocosm system (Wakeham et al. 1983)

$t_{1/2} = 4.6\text{--}21 \text{ d}$ in marine mesocosm (Wakeham et al. 1983);

$t_{1/2} = 7.9 \text{ d}$ in activated sludge (estimated, Freitag et al. 1985, quoted, Anderson et al. 1991);

$k = 0.07 \text{ yr}^{-1}$ with $t_{1/2} = 37 \text{ d}$ (Olsen & Davis 1990)

$t_{1/2}(\text{aq. aerobic}) = 1632\text{--}3600 \text{ h}$, based on unacclimated aerobic river dieaway tests; $t_{1/2}(\text{aq. anaerobic}) = 6528\text{--}14400 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biotransformation: $3 \times 10^{-9} \text{ mL cell}^{-1} \text{ h}^{-1}$ (estimated, Mabey et al. 1982).

Bioconcentration, Uptake (k_1), and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: photodecomposition $t_{1/2} = 8.7 \text{ h}$ under simulated atmospheric conditions, with NO (Dilling et al. 1976); residence time of 13 d, loss of 7.4% in one day or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

estimated atmospheric lifetime $\tau = 13 \text{ d}$ due to reaction with OH radical and $\tau > 8.8 \text{ yr}$ due to reaction with O_3 (Atkinson et al. 1985);

$t_{1/2} = 72.9\text{--}729 \text{ h}$, based on photooxidation half-life in air (Howard et al. 1991).

Surface Water: $t_{1/2} = 0.3 \text{ d}$ in surface waters in case a first order reduction process may be assumed (Zoeteman et al. 1980)

$t_{1/2} = 75 \text{ d}$ for an estuarine river with near natural conditions at 22°C (Lee & Ryan 1976);

rate constants: $k = 0.033 \text{ d}^{-1}$, $t_{1/2} = 21 \text{ d}$ in spring at 8–16°C, $k = 0.152 \text{ d}^{-1}$, $t_{1/2} = 4.6 \text{ d}$ in summer at 20–22°C, $k = 0.053 \text{ d}^{-1}$, $t_{1/2} = 13 \text{ d}$ in winter at 3–7°C for periods when volatilization appears to dominate, and $k = 0.08 \text{ d}^{-1}$, $t_{1/2} = 8.9 \text{ d}$ with HgCl_2 in September 9–15, 1980 in marine mesocosm experiments (Wakeham et al. 1983)

$t_{1/2} = 1632\text{--}3600$ h, based on unacclimated aerobic river dieaway tests (Howard et al. 1991)

photolysis $t_{1/2} = 21$ d under sunlight in water (Mansour & Feicht 1994).

Groundwater: $t_{1/2} = 3264\text{--}7200$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment: $t_{1/2} = 75$ d (Lee & Ryan 1976, 1979; quoted, Anderson et al. 1991).

Soil: disappearance $t_{1/2} = 2.1$ d from testing soils (Anderson et al. 1991);

$t_{1/2} = 1632\text{--}3600$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

6.1.1.2 1,2-Dichlorobenzene

Common Name: 1,2-Dichlorobenzene

Synonym: *o*-dichlorobenzene, dowerm E

Chemical Name: 1,2-dichlorobenzene

CAS Registry No: 95-50-1

Molecular Formula: $C_6H_4Cl_2$

Molecular Weight: 147.002

Melting Point ($^{\circ}C$):

-17.0 (Pirsch 1956; Dreisbach 1955; Weast 1972-73; 1982-83; Lide 2003)

Boiling Point ($^{\circ}C$):

180 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.3048 (Weast 1972-73; Horvath 1982)

1.3059 (Lide 2003)

Molar Volume (cm^3/mol):

112.6 ($20^{\circ}C$, calculated-density)

137.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.93 (Weast 1972-73)

Entropy of Fusion, ΔS_{fus} (J/mol K):

50.46 (Pirsch 1956)

50.63 (Yalkowsky & Valvani 1980)

Fugacity Ratio at $25^{\circ}C$, F: 1.0 (Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

145* (volumetric, measured range $20-60^{\circ}C$, Klemenc & Low 1930; Seidell 1941)

< 260 (residue-volume method, Booth & Everson 1948)

92.7 (Landolt-Börnstein 1951)

79.0 (shake flask-radiolabeled ^{14}C -LSC, Metcalf et al. 1975)

148* ($20^{\circ}C$, shake flask-GC/ECD, measured $0-34^{\circ}C$, Chiou & Freed 1977)

92.8 (shake flask-UV, Yalkowsky et al. 1979)

154 (shake flask-LSC/ ^{14}C , Veith et al. 1980)

128, 124* ($20^{\circ}C$; elution chromatography, UV, Schwarz & Miller 1980)

155.8 (shake flask-LSC, Banerjee et al. 1980; Banerjee 1985)

99.1 (shake flask-GC, Könemann 1981)

92.6 (recommended, Horvath 1982)

154 (shake flask-GC, Chiou et al. 1982, 1983; Chiou 1981, 1985; Chiou & Schmedding 1981)

125 (quoted average, Yalkowsky et al. 1983)

92.3 (generator column-GC, Miller et al. 1984, 1985)

137 (shake flask-HPLC, Banerjee 1984)

147* (recommended, temp range $0-60^{\circ}C$, IUPAC Solubility Data Series, Hovath & Getzen 1985)

$S/(g/kg) = 19.2314 - 1.81140 \times 10^{-1} \cdot (T/K) + 5.6509 \times 10^{-4} \cdot (T/K)^2 - 5.77683 \times 10^{-7} \cdot (T/K)^3$, temp range 273-333 K (regression of literature data, IUPAC Solubility Data Series, Horvath & Getzen 1985)

169 (shake flask-radiometry, Lo et al. 1986)

156 (quoted lit. average, Riddick et al. 1986; Howard 1989)

31* ($19.5^{\circ}C$, shake flask-GC/TC, measured range $0-90^{\circ}C$, Stephenson 1992)

145 (dialysis tubing equilibration-GC, Etzweiler et al. 1995)

- 159.2 (shake flask-GC/ECD, Tam et al. 1996)
 144 (20°C, limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 109 (shake flask-GC, Boyd et al., 1998)
 92, 93, 137; 97 (quoted lit. values; solid-phase micro-extraction SPME-GC, Paschke et al. 1998)
 $\ln x = -31.5289 + 3834/(T/K) + 8.7172 \times 10^{-5} \cdot (T/K)^2$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
 149* ± 8.2 (shake flask-GC/FID, measured range 5–45°C, Ma et al. 2001)
 140, 124, 158 (5, 15, 25°C, estimated-RP-HPLC- k' correlation, Finizio & Di Guardo 2001)
 93.7* (generator column-GC/ECD, measured range 15–55°C, Oleszek-Kudlak et al. 2004)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 137* (20°C, summary of literature data, Stull 1947)
 $\log (P/\text{mmHg}) = 7.32585 - 1824.6/(230 + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)
 5010* (56.28°C, ebulliometry, measured range 87.02–180.48°C, Dreisbach & Shrader 1949)
 171 (calculated by formula., Dreisbach 1955)
 $\log (P/\text{mmHg}) = 6.92400 - 1538.3/(200.0 + t/^\circ\text{C})$; temp range 80–250°C (Antoine eq. for liquid state, Dreisbach 1955)

 3.49 (shake flask-GC, Pereira et al. 1988)
 3.38 (recommended, Sangster 1993)
 3.43 (recommended, Hansch et al. 1995)
 3.29 \pm 0.05 (shake flask-GC/ECD, Bahadur et al. 1997)
 3.29* (shake flask-GC/ECD, measured range 5–45°C, Bahadur et al. 1997)
 $\log K_{OW} = 0.1831 + 17800/[2.303\cdot R(T/K)]$; temp range 5–45°C (van't Hoff eq., Bahadur et al. 1997)
 3.447 (solid-phase micro-extraction SPME-GC, Paschke et al. 1998)
 3.70 (shake flask-dialysis tubing-HPLC/UV, both phases, Andersson & Schröder 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ and the reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 4.36*, 4.41 (generator column-GC, measured range –10 to 20°C; calculated, Harner & Mackay 1995)
 $\log K_{OA} = -4.30 + 2574.0/(T/K)$; $\Delta H_{OA} = 49.3$ kJ/mol (generator column-GC, Harner & Mackay 1995)
 4.68 (solid-phase microextraction SPME-GC, Treves et al. 2001)
 $\log K_{OA} = -7.90 + 3304/(T/K)$, $\Delta H_{OA} = 63.3$ kJ/mol (SPME-GC, Treves et al. 2001)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

- 1.95 (bluegill sunfish, Veith et al. 1979b; 1980)
 2.19–2.48 (fish, calculated, Veith et al. 1980)
 1.95 (bluegill sunfish, whole body, flow system, Barrows et al. 1980)
 2.86 (microorganisms-water, Mabey et al. 1982)
 2.40–2.48 mean 2.43; 2.60–2.85 mean 2.74 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
 3.51–3.80 (rainbow trout, lipid-basis, Oliver & Niimi 1983)
 2.43–2.75 (fish, Oliver 1984)
 1.95 (correlated-flow through method, bluegill sunfish, Davis & Dobbs 1984)

- 1.60 (fish-normalized, Tadokoro & Tomita 1987)
 1.89 (fish, calculated-MCI χ , Sabljic 1987b)
 3.94, 4.46, 3.79, 3.82 (field data: Atlantic croaker, blue crabs, spotted sea trout, blue catfish, lipid-based, Pereira et al. 1988)
 2.4 \pm 0.1 (guppies, steady-state conditions, rate const. ratio k_1/k_2 , 96-h exposure, Sijm et al. 1993)
 3.5 \pm 0.1 (guppies, lipid normalized BCF, Sijm et al. 1993)
 2.70 (fathead minnow, steady-state conditions, rate const. ratio k_1/k_2 , 96-h exposure, Sijm et al. 1993)
 3.90 (fathead minnow, lipid normalized BCF, Sijm et al. 1993)
 1.95; 2.43, 2.75 (*Lepomis macrochirus*; *Oncorhynchus mykiss*, quoted lit., flow through conditions, Devillers et al. 1996)
 2.40; 2.70 (*Poecilla reticulata*; *Pimephales promelas*, quoted lit., static and semi-static conditions, Devillers et al. 1996)
 2.43, 3.51; 2.333, 2.549 (quoted: whole fish, lipid content; calculated-MCI χ , calculated- K_{OW} , Lu et al. 1999)
 3.86; 3.84 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 2.26 (Willamette silt loam soil, 1.6% organic matter, equilibrium sorption isotherm measurement, Chiou et al. 1979)
 3.0, 2.96, 2.62 (calculated- K_{OW} , solubility C_L , C_S , Karickhoff 1981)
 4.60; 4.60; 3.00 (field data of sediment trap material, Niagara River organic matter, calculated from K_{OW} , Oliver & Charlton 1984)
 2.34, 2.59 (Lula aquifer 0.032% OC, Apalachee soil 1.4% OC, batch equilibrium-sorption isotherm, Stauffer & MacIntyre 1986)
 2.45 (untreated Marlette soil A horizon, organic carbon OC 2.59%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 3.27, 2.04 (organic cations treated Marlette soil A horizon: HDTMA treated OC 6.48%; DDTMA treated, OC 4.37%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 2.43 (untreated Marlette soil B_t horizon, OC 0.30%, batch equilibrium, Lee et al. 1989)
 3.64, 3.52 (organic cations treated Marlette soil B_t horizon: HDTMA treated OC 3.72%, DDTMA treated OC 1.98%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
 2.45–3.51 (aquifer materials, Stauffer et al. 1989)
 3.10, 2.90; 2.99 (Captina silt loam, OC 1.49% and pH 4.97, McLaurin sandy loam, OC 0.66%, pH 4.43; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)
 2.36–2.61 (16 U.S. soils, 1.03–6.09% OC, batch equilibrium-sorption isotherm, Kile et al. 1995)
 2.37–2.51 (16 Chinese soils, 0.16–5.61% OC, batch equilibrium-sorption isotherm, Kile et al. 1995)
 2.48–2.76 (14 U.S. bed sediments, 0.4–2.20% OC, batch equilibrium-sorption isotherm, Kile et al. 1995)
 2.62–2.78 (21 Chinese bed sediments, 0.11–4.73% OC, batch equilibrium-sorption isotherm, Kile et al. 1995)
 2.36–2.63 (suspended solids from four U.S. rivers, 1.78–2.87% OC, batch equilibrium-sorption isotherm, Kile et al. 1995)
 2.48 (suspended solids from Yellow River, China, 0.30% OC, batch equilibrium-sorption isotherm, Kile et al. 1995)
 2.39, 2.40 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
 3.69 \pm 0.74 (suspended particulate in coastal waters, Masunaga et al. 1996)
 2.50, 2.50, 2.47 (soils: organic carbon OC \geq 0.1%, OC \geq 0.5%, 0.1 \leq OC $<$ 0.5%, average, Delle Site 2001)
 2.70, 2.69, 2.71 (sediments, organic carbon OC \leq 0.1%, OC \leq 0.5%, 0.1 \leq OC $<$ 0.5%, average, Delle Site 2001)

Sorption Coefficient, log K_{OM} :

- 2.25 (Willamette silt loam soil, 1.6% organic matter, equilibrium isotherm, Chiou et al. 1979; quoted, Howard 1989)
 2.27 (Woodburn silt loam soil, 1.9% organic matter, batch equilibrium-sorption isotherm-GC/ECD, Chiou et al. 1983)
 2.50 (soil, Chiou et al. 1983)
 2.26, 2.54 (quoted, calculated-MCI χ , Sabljic 1984)

- 2.89 (untreated Marlette soil A horizon, organic matter OM 5.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 3.47, 3.17 (organic cations treated Marlette soil A horizon: HDTMA treated, organic matter 10.03%; DDTMA treated, OM 5.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.97 (untreated Marlette soil B_t horizon, OM 0.60%, equilibrium isotherm, Lee et al. 1989)
- 3.97, 3.50, 2.87 (organic cations treated Marlette soil B_t horizon: HDTMA treated OM 4.85%, DDTMA treated OM 2.73%, NTMA treated, OM 1.74%, batch equilibrium-adsorption isotherm, Lee et al. 1989)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: experimental evaporation rate into air, $1.18 \times 10^{-6} \text{ g cm}^{-2} \text{ s}^{-1}$ (Chiou et al. 1980); estimated $t_{1/2} = 4.4 \text{ h}$ for a model river of 1-m depth with a flow rate of 1 m/s and wind velocity of 3 m/s at 20°C (Lyman et al. 1982).

Photolysis: not environmentally significant (Mabey et al. 1982); rate constant $k = 1.22 \times 10^{-4} \text{ h}^{-1}$ with H_2O_2 under photolysis at 25°C in F-113 solution and with HO^- in the gas (Dilling et al. 1988).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical, and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} \sim 3.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 38.6 d, loss of 2.6% in one day or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $\ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 radical (Mabey et al. 1982)

$k_{\text{OH}} = (4.2 \pm 0.2) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (flash photolysis-resonance fluorescence, Wahner & Zetzsch 1983)

$k_{\text{O}_3} = 2.0 \times 10^{-23} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K measured range 298–323 K (Atkinson & Carter 1984)

k_{OH} (obs.) = $4.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; and k_{OH} (calc) = $4.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

k_{OH} (calc) = $4.1 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, k_{OH} (obs) = $4.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}} = 4.07 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 22–27°C (Dilling et al. 1988)

$k = (3.7\text{--}4.0) \times 10^{-9} \text{ M}^{-1} \text{ s}^{-1}$ for the reaction of OH radical with benzene at pH 7 in aqueous solution (Kochany & Bolton 1992)

k_{OH} (calc) = $4.0 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ in aqueous solutions (Haag & Yao 1992)

k_{OH} (calc) = $0.48 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis: not environmentally significant (Mabey et al. 1982).

base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C with a calculated $t_{1/2} > 900 \text{ yr}$ at pH 7, based on assumed bases mediated 1% disappearance after 16 d at 85°C and pH 9.70 (Ellington et al. 1988)

Biodegradation: $t_{1/2}$ (aq. aerobic) = 672–4320 h, based on unacclimated soil grab sample data, and aerobic screening test data (Howard et al. 1991);

$t_{1/2}$ (aq. anaerobic) = 2880–17280 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

significant degradation in an aerobic environment with $k = 0.05 \text{ d}^{-1}$ (Tabak et al. 1981; Mills et al. 1982); in a continuous flow of activated sludge system; virtually 100% (78% biodegradation and 22% stripping) was observed (Kincannon et al. 1983; selected, Howard 1989).

Biotransformation: $1 \times 10^{-10} \text{ ml cell}^{-1} \text{ h}^{-1}$ (estimated, Mabey et al. 1982).

Bioconcentration, Uptake (k_1), and Elimination (k_2) Rate Constants:

$k_1 = 870 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 3.90 \text{ d}^{-1}$ (guppy, 96-h exposure., Sijm et al. 1993)

$k_1 = 635 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 1.40 \text{ d}^{-1}$ (fathead minnow, 96-h exposure, Sijm et al. 1993)

Half-Lives in the Environment:

Air: residence time of 38.6 d, loss of 2.6% in one day or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 152.8\text{--}1528 \text{ h}$, based on the photooxidation half-life in air. (Howard et al. 1991)

Surface water: $t_{1/2} = 1.2\text{--}37 \text{ d}$ estimated from field data at various locations in the Netherlands, $t_{1/2} = 0.3\text{--}3 \text{ d}$ for river, $t_{1/2} = 3\text{--}30 \text{ d}$ for lakes (Zoeteman et al. 1980)

$t_{1/2} = 672\text{--}4320 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Groundwater: $t_{1/2} = 30\text{--}300 \text{ d}$, estimated from persistence in water (Zoeteman et al. 1980);

$t_{1/2} \sim 1$ yr estimated from observed persistence in groundwater of the Netherlands (Zoeteman et al. 1981)

$t_{1/2} = 1344\text{--}8640$ h, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on unacclimated aerobic screening test data (Howard et al. 1991)

disappearance $t_{1/2} = 4.0$ d in testing soils (Anderson et al. 1991).

Biota: $t_{1/2} < 1$ d in fish (Veith et al. 1980);

$t_{1/2} < 1$ d bluegill sunfish. (Barrows et al. 1980);

$t_{1/2} < 5$ d in worms at 8°C (Oliver 1987a);

biological half-lives: $t_{1/2} < 1$ d in trout muscle, $t_{1/2} < 1$ d in sunfish and $t_{1/2} < 1$ d in guppy for dichlorobenzenes (Niimi 1987).

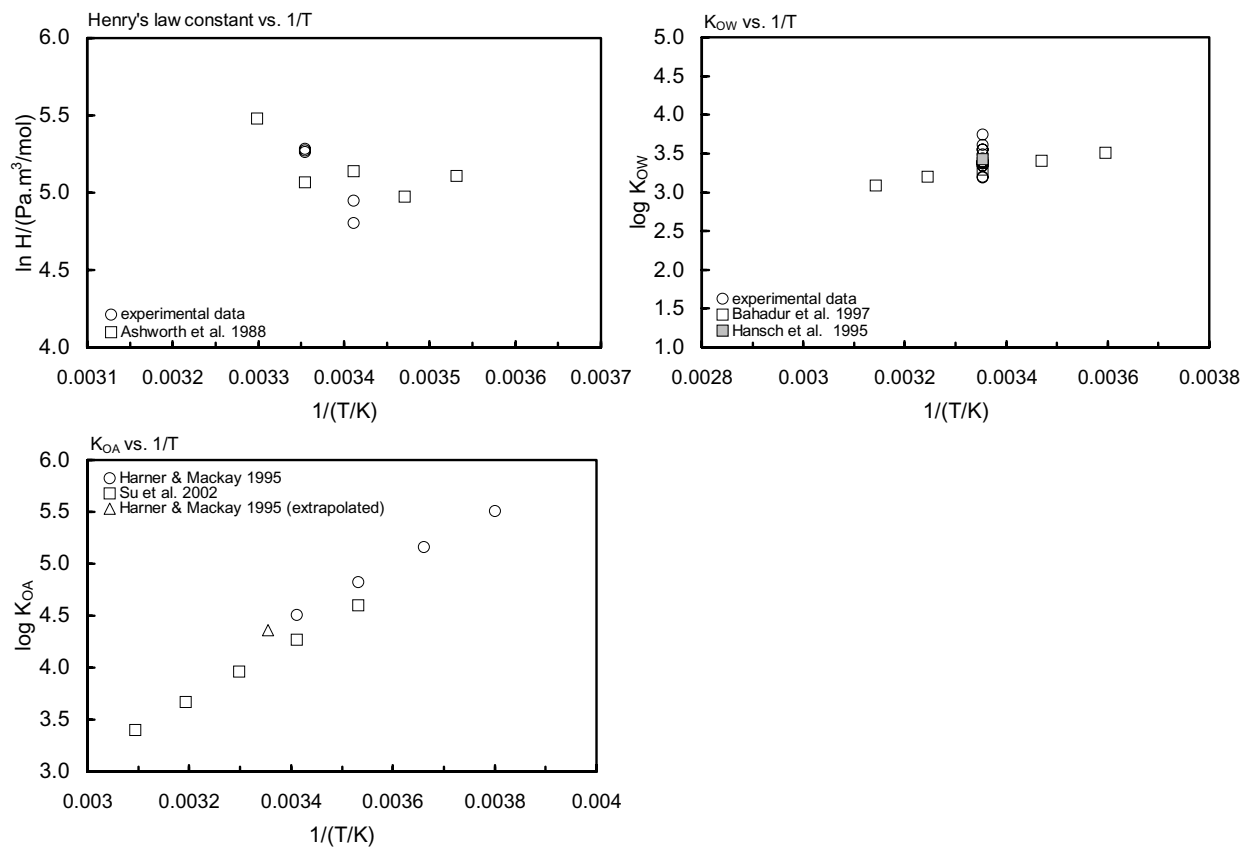

FIGURE 6.1.1.2.3 Logarithm of Henry's law constant, K_{OW} and K_{OA} versus reciprocal temperature for 1,2-dichlorobenzene.

6.1.1.3 1,3-Dichlorobenzene

Common Name: 1,3-Dichlorobenzene

Synonym: *m*-dichlorobenzene

Chemical Name: 1,3-dichlorobenzene

CAS Registry No: 541-73-1

Molecular Formula: C₆H₄Cl₂

Molecular Weight: 147.002

Melting Point (°C):

-24.8 (Lide 2003)

Boiling Point (°C):

173 (Lide 2003)

Density (g/cm³ at 20°C):

1.2884 (Dreisbach 1955; Weast 1972–73; Horvath 1982; Lide 2003)

Molar Volume (cm³/mol):

114.1 (20°C, calculated-density)

137.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.64 (Weast 1972–73)

Entropy of Fusion, ΔS_{fus} (J/mol K):

50.63 (Pirsch 1956)

51.46 (Yalkowsky 1979)

51.05 (Yalkowsky & Valvani 1980)

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

123* (volumetric, measured range 20–60°C, Klemenc & Löw 1930)

123.5 (Ginnings et al. 1939)

124 (Landolt-Börnstein 1951)

101.26* (shake flask-UV, measured range 10–35°C, Vesala 1973)

102.9 (shake flask-UV, Vesala 1974)

119.5 (shake flask-UV, Yalkowsky et al. 1979)

131 (shake flask-LSC-¹⁴C, Veith et al. 1980)

144*, 149 (23.5°C, elution chromatography, measured range 10–30°C, Schwarz 1980)

111, 89, 113, 101 (20°C, quoted, UV, elution chromatography, average exptl. value, Schwarz & Miller 1980)

133.5 (shake flask-LSC, Banerjee et al. 1980)

68.6 (shake flask-GC, Könemann 1981)

134 (shake flask-GC/ECD, Chiou & Schmedding 1981; Chiou et al. 1982, 1983; Chiou 1985)

124 (recommended, Horvath 1982)

124.5 (generator column-GC/ECD, Miller et al. 1984, 1985)

143 (shake flask-HPLC, Banerjee 1984)

106* (recommended, temp range 10–60°C, IUPAC Solubility Data Series, Horvath & Getzen 1985)

S/(g/kg) = 27.6827 – 2.61597 × 10⁻¹·(T/K) + 8.19706 × 10⁻⁴·(T/K)² – 8.4698 × 10⁻⁷·(T/K)³, temp range 283–333 K
(regression of literature data, IUPAC Solubility Data Series, Horvath & Getzen 1985)

110 (Dean 1985)

111 (20°C, Riddick et al. 1986)

130 (20°C, limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

123; 138 (quoted lit.; shake flask-GC, Boyd et al. 1998)

126* \pm 6.1 (shake flask-GC/FID, measured range 5–45°C, Ma et al. 2001)

71, 104, 132, 166 (5, 15, 25, 35°C, estimated-RP-HPLC- k' correlation, Finizio & Di Guardo 2001)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (12.1°C, summary of literature data, Stull 1947)

$\log(P/\text{mmHg}) = 7.30364 - 1782.4/(C + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)

7605* (90.72°C, ebulliometry, measured range 90.72–173.0°C, Dreisbach & Shrader 1949)

252 (calculated by formula., Dreisbach 1955)

$\log(P/\text{mmHg}) = 6.88045 - 1496.2/(201.0 + t/^\circ\text{C})$; temp range 75–240°C (Antoine eq. for liquid state, Dreisbach 1955)

307 (extrapolated, Antoine eq., Weast 1972–73)

$\log(P/\text{mmHg}) = [-0.2185 \times 10446.8/(T/K)] + 8.017555$; temp range 12.1–173°C (Antoine eq., Weast 1972–73)

266 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log(P/\text{kPa}) = 6.17083 - 1611.121/(213.817 + t/^\circ\text{C})$; temp range 90.7–173°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)

179.3 (gas saturation, interpolated from reported graph, Rordorf 1985)

265 (extrapolated-Antoine eq., Dean 1985)

$\log(P/\text{mmHg}) = 7.0401 - 1607.05/(213.38 + t/^\circ\text{C})$; temp range 91–173°C (Antoine eq., Dean 1985, 1992)

243 (extrapolated, Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.00535 - 1496.2/(-72.15 + T/K)$; temp range 348–513 K (liquid, Antoine eq., Stephenson & Malanowski 1987)

236 (supercooled liquid P_L , GC-Kovács retention indices correlation; Spieksma et al. 1994)

190.4* (20.39°C, static-pressure gauge, measured range –25 to 159°C, Polednicek et al. 1996)

$\ln(P/\text{Pa}) = 21.6433 - 4031.27/[(T/K) - 47.5846]$; temp range 249–432 K (Antoine eq. from exptl data, pressure gauge measurement, Polednicek et al. 1996)

$\log(P/\text{mmHg}) = 3.2904 - 2.5839 \times 10^3/(T/K) + 3.893 \cdot \log(T/K) - 9.5398 \times 10^{-3} \cdot (T/K) + 4.6397 \times 10^{-6} \cdot (T/K)^2$, temp range 248–684 K, (Yaws 1994)

5731* (84.353°C, comparative ebulliometry, measured range 84.353–175.207°C, Roháč et al. 1998)

185.0* (20°C, recommended, summary of literature data, temp range 263.15–463.15 K, Roháč et al. 1999)

$\ln[(P/\text{Pa})/4.85] = [1 - (T/K)/248.39] \cdot \exp\{3.366439 - 8.3811530 \times 10^{-4} \cdot (T/K) + 5.9337577 \times 10^{-7} \cdot (T/K)^2\}$; temp range 250–448 K (Cox eq., recommended, Roháč et al. 1999)

$\log(P/\text{Pa}) = 21.6433 - 4031.27/[(T/K) - 47.5846]$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

472 (calculated as $1/K_{AW} \cdot C_W/C_A$, reported as exptl., Hine & Mookerjee 1975; selected exptl., Nirmalakhandan & Speece 1988a)

375 (calculated-bond contribution, Hine & Mookerjee 1975)

182 (20°C, batch air stripping-GC, Oliver 1985)

267 (gas stripping-GC, Warner et al. 1987)

289* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)

$\ln[H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 2.882 - 2564/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)

328 (computer value, Yaws et al. 1991)

216 (20°C, equilibrium gas stripping-GC, Hovorka & Dohnal 1997)

269 (21°C, headspace equilibrium-GC, de Wolf & Lieder 1998)

288 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 2.436 - 986/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

3.55 (Hansch et al. 1968)

3.38 (Leo et al. 1971; Hansch & Leo 1979)

3.57, 3.55 (calculated-fragment constants, Rekker 1977)

- 3.60 (shake flask-GC, Könemann et al. 1979)
- 3.62 (HPLC- k' correlation, Könemann et al. 1979)
- 3.44 (shake flask-LSC, Banerjee et al. 1980)
- 3.44 (shake flask-LSC, Veith et al. 1980; Oliver & Niimi 1983)
- 3.95 (HPLC-RT correlation, Veith et al. 1980)
- 3.53 (shake flask-GC, Watarai et al. 1982)
- 3.46 (shake flask-HPLC, Hammers et al. 1982)
- 3.38–3.62, 3.52 (range, mean, shake flask method, Eadsforth & Moser 1983)
- 3.62–3.95, 3.73 (range, mean, HPLC method, Eadsforth & Moser 1983)
- 3.48 (generator column-HPLC/UV, Wasik et al. 1983)
- 3.48 (generator column-GC/ECD, Miller et al. 1984; 1985)
- 3.57 (HPLC-RV correlation, Garst 1984)
- 3.60 (Hansch & Leo 1985)
- 3.55* (19°C, shake flask-GC, measured range 13–33°C, Opperhuizen et al. 1988)
- 3.50 (shake flask-GC, Pereira et al. 1988)
- 3.525 (slow stirring, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
- 3.52 (recommended, Sangster 1993)
- 3.53 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated. Additional data at other temperatures designated

* are compiled at the end of this section:

- 4.36 (calculated- S_{oct} and vapor pressure, Abraham et al. 2001)
- 4.27* (20°C, HPLC- k' correlation, measured range 10–50°C, Su et al. 2002)
- $\log K_{OA} = 57020/(2.303 \cdot RT) - 5.856$; temp range 10–50°C (HPLC- k' correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 1.82 (bluegill sunfish, Veith et al. 1979b; 1980)
- 1.82 (bluegill sunfish, whole body, flow system, Barrows et al. 1980)
- 2.86 (microorganisms-water, Mabey et al. 1982)
- 2.57–2.68 mean 2.62; 2.74–2.96 mean 2.87 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
- 3.70–4.02 (rainbow trout, lipid base, Oliver & Niimi 1983)
- 2.62–2.87 (fish, Oliver 1984)
- 1.99 (fathead minnow, flowing water, Carlson & Kosian 1987)
- 3.77, 3.78, 3.83, 3.84 (13, 19, 28, 33°C, female guppy, Opperhuizen et al. 1988)
- 3.60, 3.86, 3.25, 3.40 (field data-lipid based: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
- 1.82; 2.62, 2.87 (*Lepomis macrochirus*; *Oncorhynchus mykiss*, quoted lit., flow through conditions, Devillers et al. 1996)
- 3.78 (*Poecilia reticulata*, quoted lit., static and semi-static conditions, Devillers et al. 1996)
- 2.62, 3.70; 2.553, 2.305 (quoted: whole fish, lipid content; calculated-QSPR-MCI χ , K_{OW} , Lu et al. 1999)
- 3.79; 3.75 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.50; 4.10 (field data of sediment trap material; Niagara River-organic matter, Oliver & Charlton 1984)
- 2.14 (soil, Lee et al. 1989)
- 2.48 (soil, calculated-QSAR-MCI χ , Sabljic et al. 1995)
- 2.43, 2.58, 2.88 (RP-HPLC- k' correlation on three different stationary phases, Szabo et al. 1995)
- 2.60, 2.60 (RP-HPLC- k' correlation including MCI related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
- 3.47 \pm 0.74 (suspended particulate in coastal waters, Masunaga et al. 1996)
- 2.49, 2.53 (soils: organic carbon OC \geq 0.1%, OC \geq 0.5%, average, Delle Site 2001)

Sorption Partition Coefficient, $\log K_{OM}$:

- 2.23 (Woodburn silt loam soil, 1.9% organic matter, equilibrium sorption isotherm, Chiou et al. 1983)
 3.88 (micelle-water, Valsaraj & Thibodeaux 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} = 4.1$ h from a model river of 1 m depth with a current of 1 m/s and wind velocity of 3 m/s at 20°C (Lyman et al. 1982).

Photolysis: not environmentally significant or relevant (Mabey et al. 1982);

$k = 1.9 \times 10^{-4} \text{ h}^{-1}$ with H_2O_2 at 25°C in F-113 solution and with HO• in the gas (Dilling et al. 1988);
 pseudo-first-order direct photolysis $k(\text{exptl}) = (0.008 \pm 0.001) \text{ min}^{-1}$ with $t_{1/2} = (92.3 \pm 6.4) \text{ min}$ in aqueous solution (Peijnenburg et al. 1992)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} \sim 3.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 38.6 d, loss of 2.6% in one day or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 radical (Mabey et al. 1982)

$k_{OH} = (7.2 \pm 0.2) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (flash photolysis-resonance fluorescence, Wahner & Zetzsch 1983)

$k_{OH}(\text{obs.}) = 7.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; and $k_{OH}(\text{calc.}) = 11.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{OH}(\text{calc.}) = 1.01 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 0.72 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k(\text{aq.}) = (0.57 \pm 0.005) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} = 16$ h at pH 7 (Yao & Haag 1991).

$k(\text{aq.}) = (5.4\text{--}5.9) \times 10^{-9} \text{ M}^{-1} \text{ s}^{-1}$ for the reaction of OH radical with benzene at pH 7 in aqueous solution (Kochany & Bolton 1992)

$k_{HO\cdot}(\text{aq.}) = (5.0 \pm 1.0) \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ in aqueous solutions (Haag & Yao 1992)

$k_{OH} = 0.46 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis: not environmentally significant (Mabey et al. 1982)

base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C with a calculated $t_{1/2} > 900$ yr at pH 7, based on assumed bases mediated 1% disappearance after 16 d at 85°C and pH 9.70 (Ellington et al. 1988)

first-order $t_{1/2} > 879$ yr, based on rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ extrapolated to pH 7 at 25°C from 1% disappearance after 16 d at 85°C and pH 9.7 (Howard et al. 1991).

Biodegradation: significant degradation in an aerobic environment with rate constant $k = 0.05 \text{ d}^{-1}$ (Tabak et al. 1981; Mills et al. 1982);

nearly 100% removed by an apparent combination of biodegradation and stripping in a continuous flow activated sludge system (Kincannon et al. 1983; selected, Howard 1989)

$t_{1/2}(\text{aq. aerobic}) = 672\text{--}4320$ h, estimated from unacclimated soil grab sample data; $t_{1/2}(\text{aq. anaerobic}) = 2688\text{--}17280$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biotransformation: $k = 1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ (estimated, Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: residence time of 38.6 d, loss of 2.6% in one day or 12 sunlit hour at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 200.6\text{--}2006$ h, based on photooxidation half-life in air (Howard et al. 1991).

Surface Water: $t_{1/2} = 0.9\text{--}50$ d, various locations in the Netherlands in case of a first order reduction process may be assumed (estimated, Zoeteman et al. 1980)

$t_{1/2} = 672\text{--}4320$ h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991)

measured rate constant $k = (0.57 \pm 0.05) \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 22°C, with $t_{1/2} = 16$ h at pH 7 (Yao & Haag 1991)

direct photolysis $t_{1/2} = 92.3$ min in aqueous solution (Peijnenburg et al. 1992).

Groundwater: $t_{1/2} = 1$ yr estimated from observed persistence in groundwater of the Netherlands (Zoeteman et al. 1981)

$t_{1/2} = 1334\text{--}8640$ h, based on aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on unacclimated aerobic screening test data and aerobic soil grab sample data (Howard et al. 1991).

Biota: $t_{1/2} < 1$ d in bluegill sunfish (Veith et al. 1980; Barrows et al. 1980)

$t_{1/2} < 5$ d in worm at 8°C (Oliver 1987a);

biological half-lives, $t_{1/2} < 1$ d in trout muscle, $t_{1/2} < 1$ d in sunfish, and $t_{1/2} < 1$ d in guppy for dichlorobenzenes (Niimi 1987).

FIGURE 6.1.1.3.1 Logarithm of mole fraction solubility (ln x) versus reciprocal temperature for 1,3-dichlorobenzene.

TABLE 6.1.1.3.2
Reported vapor pressures of 1,3-dichlorobenzene at various temperatures and the coefficients for the vapor pressure equations

$\log P = A - B/(T/K)$	(1)	$\ln P = A - B/(T/K)$	(1a)
$\log P = A - B/(C + t/^{\circ}\text{C})$	(2)	$\ln P = A - B/(C + t/^{\circ}\text{C})$	(2a)
$\log P = A - B/(C + T/K)$	(3)	$\ln P = A - B/(C + T/K)$	(3a)
$\log P = A - B/(T/K) - C \cdot \log (T/K)$	(4)		
$\ln (P/P_0) = (1 - T/T_0) \cdot \exp[\sum A_i T^i]$	(5) - Cox eq.

FIGURE 6.1.1.3.3 Logarithm of Henry's law constant, K_{OW} and K_{OA} versus reciprocal temperature for 1,3-dichlorobenzene.

6.1.1.4 1,4-Dichlorobenzene

Common Name: 1,4-Dichlorobenzene

Synonym: *p*-dichlorobenzene, paradichlorobenzene

Chemical Name: 1,4-dichlorobenzene

CAS Registry No: 106-46-7

Molecular Formula: $C_6H_4Cl_2$

Molecular Weight: 147.002

Melting Point ($^{\circ}C$):

53.09 (Lide 2003)

Boiling Point ($^{\circ}C$):

174 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.2457 (Dreisbach 1955; Weast 1972–73; Horvath 1982)

Molar Volume (cm^3/mol):

118.0 ($20^{\circ}C$, calculated-density)

137.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

18.72 (Dreisbach 1955)

17.882 (Weast 1972–73)

18.16, 18.70 (Wauchope & Getzen 1972)

18.20 (Tsonopoulos & Prausnitz 1971; Dean 1985)

19.0 (Miller et al. 1984)

17.153 (Ruelle et al. 1993)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56.484 (Pirsch 1956)

55.65 (Tsonopoulos & Prausnitz 1971)

54.81 (Weast 1976–77; Amidon & Williams 1982; Yalkowsky 1979)

56.07 (Yalkowsky & Valvani 1980)

58.16 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F : 0.53 (mp at $53.09^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

79.1* (volumetric method, measured range 20 – $60^{\circ}C$, Klemenc & Löw 1930)

77 ($30^{\circ}C$, shake flask-interferometer, Gross & Saylor 1930)

< 500 (residue-volume method, Booth & Everson 1948)

76 (shake flask-UV, Andrew & Keefer 1950)

89.8 (Landolt-Börnstein 1951)

83.4* ($24.6^{\circ}C$, shake flask-UV, measured 22.2 – $73.4^{\circ}C$, Wauchope & Getzen 1972)

85.5 (shake flask-UV, Vesala 1974)

56.9 ($20^{\circ}C$, shake flask-GC/ECD, Chiou & Freed 1977)

34 (shake flask-GC, Jones et al. 1977/1978)

87.2 (shake flask-GC, Aqun-Yuen et al. 1979)

90.6 (shake flask-UV, Yalkowsky et al. 1979)

73.7 (shake flask-LSC, Veith et al. 1980)

73.8 (shake flask-LSC, Banerjee et al. 1980)

48.7 (shake flask-GC, Könnemann 1981)

73, 137 (shake flask-GC, solid, supercooled liquid, Chiou et al. 1982)

90.0	(recommended, Horvath 1982)
25	(calculated-UNIFAC activity coefficients, Arbuckle 1983)
175	(calculated-HPLC- k' , converted from reported γ_w , Hafkenscheid & Tomlinson 1983a)
154	(30°C, shake flask-GC, McNally & Grob 1983)
30.9	(generator column-GC, Miller et al. 1984, 1985)
65.3	(shake flask-HPLC, Banerjee 1984)
158	(30°C, shake flask-GC, McNally & Grob 1984)
82.9*	(recommended, temp range 10–75°C, IUPAC Solubility Data Series, Horvath & Getzen 1985)
$S/(g/kg) = 13.974 - 8.5829 \times 10^{-2} \cdot (T/K) + 1.3365 \times 10^{-4} \cdot (T/K)^2$; temp range 328–348 K (regression of literature data, IUPAC Solubility Data Series, Horvath & Getzen 1985)	
100	(Dean 1985)
141	(20°C, limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)
81.4* \pm 1.5	(shake flask-GC/ECD, measured range 5–45°C, Shiu et al. 1997)
42.0	(shake flask-GC, Boyd et al. 1998)
$\ln x = -4.178 - 2186.7/(T/K)$; temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)	

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1333*	(54.8°C, summary of literature data, temp range 54.8–173.9°C, Stull 1947)
$\log (P/\text{mmHg}) = 7.30697 - 1788.7/(230 + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)	
7605*	(92.0°C, ebulliometry, measured range 92.0–174.12°C, Dreisbach & Shrader 1949)
235	(calculated by formula., Dreisbach 1955; quoted, Hine & Mookerjee 1975; Riddick et al. 1986; Howard 1989)
$\log (P/\text{mmHg}) = 6.89797 - 1507.3/(201.0 + t/^\circ\text{C})$; temp range 75–240°C (Antoine eq. for liquid state, Dreisbach 1955)	
8514*	(94.8°C, ebulliometry, measured range 94.8–174.04°C, McDonald et al. 1959)
93.33*	(20.4°C, α - <i>p</i> -dichlorobenzene, manometry, measured range 20.4–39.6°C, Walsh & Smith 1961)
402.6*	(37.9°C, β - <i>p</i> -dichlorobenzene, manometry, measured range 37.9–52.5°C, Walsh & Smith 1961)
90.2	(solid vapor pressure, extrapolated, Antoine eq., Weast 1972–73)
$\log (P/\text{mmHg}) = [-0.2185 \times 17260.5/(T/K)] + 12.4800$; temp range 30–50°C, (Antoine eq., Weast 1972–73)	
$\log (P/\text{mmHg}) = [-0.2185 \times 10611.0/(T/K)] + 8.073632$; temp range 54.8–173.9°C (Antoine eq., Weast 1972–73)	
137.2*	(diaphragm pressure gauge, measured range: 0–20°C, De Kruif et al. 1981)
128	(extrapolated-Antoine eq., Boublik et al. 1984)
$\log (P/\text{kPa}) = 5.94201 - 1668.355/(186.212 + t/^\circ\text{C})$; temp range 164.7–237.9°C (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)	
158*	(gas saturation-GC, measured range 20–100°C, Rordorf 1985)
243	(extrapolated-Antoine eq., Dean 1985)
$\log (P/\text{mmHg}) = 7.0208 - 1590.9/(210.2 + t/^\circ\text{C})$, temp range 95–174°C (Antoine eq., Dean 1985, 1992)	
86.7	(20°C, gas saturation, Chiou & Shoup 1985)
134	(interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
$\log (P_s/\text{kPa}) = 10.472 - 3382.9/(T/K)$; temp range 293–313 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)	
$\log (P_s/\text{kPa}) = 10.181 - 3290.4/(T/K)$; temp range 310–336 K (solid, Antoine eq.-II, Stephenson & Malanowski 1987)	
$\log (P_L/\text{kPa}) = 6.12695 - 1578.51/(-64.22 + T/K)$; temp range 341–448 K (liquid, Antoine eq., Stephenson & Malanowski 1987)	
133*	(gas saturation-GC, measured range –15 to 40°C, Liu & Dickhut 1994)
216; 257	(supercooled liquid P_L , GC-Kovács retention indices correlation; quoted lit., Spieksma et al. 1994)
$\log (P/\text{mmHg}) = 36.2276 - 3.6756 \times 10^3/(T/K) - 9.6308 \cdot \log (T/K) - 1.3372 \times 10^{-9} \cdot (T/K) + 1.9905 \times 10^{-6} \cdot (T/K)^2$; temp range 326–685 K (vapor pressure eq., Yaw et al. 1994)	
135*	(25°C; pressure gauge measurement; interpolated from reported Antoine eq., Poledniecek et al. 1996)
$\ln (P_s/\text{Pa}) = 28.4986 - 6272.86/[(T/K) - 32.2741]$; temp range 273–323 K (Antoine eq. from exptl data, pressure gauge measurement, solid, Poledniecek et al. 1996)	
$\ln (P_L/\text{Pa}) = 21.0472 - 3665.96/[(T/K) - 62.3849]$; temp range 333–442 K (Antoine eq. from exptl data, pressure gauge measurement, liquid, Poledniecek et al. 1996)	

- 5729* (85.139°C, comparative ebulliometry, measured range 85.139–175.626°C, Roháč et al. 1998)
 87.0* (20°C, recommended, summary of literature data, temp range 273.15–453.15 K, Roháč et al. 1999)
 $\ln [(P_s/P_a)/1280] = [1 - (T/K)/326.3] \cdot \exp\{3.251427 - 2.853921 \times 10^{-4} \cdot (T/K)\}$; temp range 273–323 K (Cox eq. solid, recommended, Roháč et al. 1999)
 $\ln [(P_L/P_a)/1280] = [1 - (T/K)/326.3] \cdot \exp\{3.100023 - 1.0557743 \times 10^{-3} \cdot (T/K) + 7.816354 \times 10^{-7} (T/K)^2\}$; temp range 328–449 K (Cox eq., liquid, recommended, Roháč et al. 1999)
 $\log (P/P_a) = 11.63209 - 2829.32/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

- 330 (equilibrium cell-GC, concentration ratio, Leighton & Calo 1981)
 240 (gas stripping-GC, Mackay & Shiu 1981)
 152 (20°C, gas stripping-GC, Oliver 1985)
 276 (gas stripping-GC, Warner et al. 1987)
 321* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = 3.373 - 2720/(T/K)$; temp range 10–30°C (EPICS measurements, Ashworth et al. 1988)
 438 (computer value, Yaws et al. 1991)
 244 (gas stripping-GC, Shiu & Mackay 1997)
 188 (20°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 275 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 2.649 - 1054/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, log K_{OW} at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 3.39 (shake flask, Leo et al. 1971; Hansch & Leo 1979)
 3.57, 3.55 (calculated-fragment constants, Rekker 1977)
 3.38 (Hansch & Leo 1979)
 3.62, 3.39 (shake flask-GC, HPLC-k' correlation, Könnemann et al. 1979)
 3.37, 3.78 (shake flask-LSC, HPLC-RT correlation, Veith et al. 1980)
 3.37 (shake flask-LSC, Banerjee et al. 1980)
 3.46 (HPLC-k' correlation, Hammers et al. 1982)
 3.52 (shake flask-GC, Watarai et al. 1982)
 3.43 (HPLC-k' correlation, Miyake & Terada 1982)
 3.67, 3.90 (calculated-UNIFAC activity coefficients, Arbuckle 1983)
 3.37 (generator column-HPLC/UV, Wasik et al. 1983)
 3.38 (generator column-GC/ECD, Miller et al. 1984; 1985)
 3.37 (HPLC-RV correlation, Garst 1984; Garst & Wilson 1984)
 3.52 (Hansch & Leo 1985)
 3.444 (shake flask/slow stirring-GC, De Bruijn et al. 1989)
 3.85–4.30, 4.0 (range, average: round robin work, shake flask or HPLC-k' correlation, Kishi & Hashimoto 1989)
 3.355 ± 0.053, 3.444 ± 0.001 (shake flask methods, interlaboratory studies, Brooke et al. 1990)
 3.45 (recommended, Sangster 1993)
 3.44 (recommended, Hansch et al. 1995)
 3.23* ± 0.03 (shake flask-GC/ECD, measured range 5–45°C, Bahadur et al. 1997)
 $\log K_{OW} = 0.2338 + 17100/[2.303 \cdot R(T/K)]$; temp range 5–45°C (van't Hoff eq., Bahadur et al. 1997)
 3.65 (RP-HPLC-RT correlation, short ODP column, Donovan & Pescatore 2002)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 4.46 (calculated-S_{oct} and vapor pressure P, Abraham et al. 2001)
 4.32* (20°C, HPLC-k' correlation, measured range 10–50°C, Su et al. 2002)
 $\log K_{OA} = 55590/(2.303 \cdot RT) - 5.556$; temp range 10–50°C (HPLC-k' correlation, Su et al. 2002)

Bioconcentration Factor, log BCF at 25°C or as indicated:

- 2.33 (rainbow trout, Neely et al. 1974)
 2.33 (fish, flowing water, Kenaga & Goring 1980; Kenaga 1980)
 1.78 (bluegill sunfish, Veith et al. 1979b, 1980)
 1.78 (bluegill sunfish, whole body, flow system, Barrows et al. 1980)
 3.26 (guppy, lipid basis, Könnemann & van Leeuwen 1980)
 2.53–2.59 mean 2.57; 2.79–2.96 mean 2.86 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
 3.64–3.96 (rainbow trout, lipid basis, Oliver & Niimi 1983)
 3.40 (15°C, guppy, Banerjee et al. 1984)
 2.83–2.86 (fish, Oliver 1984)
 2.00, 1.70, 2.75 (algae, fish, activated sludge, Freitag et al. 1984)
 2.0, 1.70, 2.75 (algae, fish, activated sludge, Freitag et al. 1985)
 2.32–2.72 mean 2.71; 2.74–3.15 mean 2.95 (15°C, rainbow trout, wet wt., steady-state BCF on 7- to 96-d laboratory study in two tanks with different water concn, Oliver & Niimi 1985)
 2.04 (fathead minnow, flowing water, Carlson & Kosian 1987)
 5.3–5.6, 5.5 (Niagara River plume, range, mean; Oliver 1987b)
 3.91, 4.53, 4.09, 3.51 (field data-lipid based: Atlantic creakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 3.25 (guppy, lipid weighted-based, 12 to 31 d exposure-GC, Gobas et al. 1989)
 2.47, 3.56 (flagfish: whole fish, lipid, Smith et al. 1990)
 1.7 ± 0.2 (guppy, steady-state conditions, rate const. ratio k_1/k_2 , 96-h exposure, Sijm et al. 1993)

 2.66, 2.57, 2.77 (soils: organic carbon OC ≥ 0.1%, OC ≥ 0.5%, 0.1 ≤ OC < 0.5%, average, Delle Site 2001)
 2.99–3.46 (three wetland soils, batch equilibrium-sorption isotherm-LSC, Lee et al. 2003)

Sorption Coefficient, log K_{OM} :

- 2.20 (Woodburn silt loam soil, organic matter 1.9%, equilibrium sorption isotherm, Chiou et al. 1983)

Environmental Fate Rate Constants, k or Half-Lives. $t_{1/2}$:

Volatilization: $t_{1/2} = 4.3$ h from a model river of 1 m depth and with a current of 1 m/s and wind velocity of 3 m/s at 20°C (Lyman et al. 1982);

rate constants: $k = 0.04$ d⁻¹, $t_{1/2} = 18$ d in spring at 8–16°C, $k = 0.068$ d⁻¹, $t_{1/2} = 10$ d in summer at 20–22°C, $k = 0.054$ d⁻¹, $t_{1/2} = 13$ d in winter at 3–7°C for the periods when volatilization appears to dominate, and $k = 0.066$ d⁻¹, $t_{1/2} = 10.6$ d with HgCl₂, and $k = 0.063$ d⁻¹, $t_{1/2} = 11$ d without HgCl₂ in September 9–15, in marine mesocosm experiments (Wakeham et al. 1983).

Photolysis: not environmentally significant or relevant (Mabey et al. 1982)

Direct photolysis unimportant (Zepp & Cline 1977; Zepp 1978);

$t_{1/2} = 25$ d under sunlight in water (Mansour & Feicht 1994)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures see reference:

$k = 9.63 \times 10^{-3}$ h⁻¹ in air (Ware & West 1977; selected, Mackay et al. 1985)

$k_{OH} \sim 3.0 \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹, residence time of 38.6 d, loss of 2.6% in one day or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$k \ll 360$ M⁻¹ h⁻¹ for singlet oxygen and $k \ll 1$ M⁻¹ h⁻¹ for RO₂ radical (Mabey et al. 1982)

$k \ll 3$ M⁻¹ s⁻¹ for the reaction with ozone in water using 0.5 mM *t*-BuOH as scavenger at pH 2.0 and 20–23°C (Hoigné & Bader 1983)

$k_{OH} = (3.2 \pm 0.2) \times 10^{-13}$ cm³ molecule⁻¹ s⁻¹ at 295 K (flash photolysis-resonance fluorescence, Wahner & Zetzsch 1983)

k_{OH} (obs.) = 3.2×10^{-13} cm³ molecule⁻¹ s⁻¹; and k_{OH} (calc) = 4.9×10^{-13} cm³ molecule⁻¹ s⁻¹ at room temp. (Atkinson 1985)

k_{OH} (calc) = 0.41×10^{-12} cm³ molecule⁻¹ s⁻¹, k_{OH} (obs) = 0.32×10^{-12} cm³ molecule⁻¹ s⁻¹ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH} = (0.32 - .52) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ at 295–300 K (literature review, Atkinson 1989)

$t_{1/2} = 200.6$ – 2006 h based on vapor phase reaction with OH radicals (Howard et al. 1991)

$k = (5.0 - 5.3) \times 10^9$ M⁻¹ s⁻¹ for the reaction of OH radical with benzene at pH 7 in aqueous solution (Kochany & Bolton 1992)

$k_{HO\cdot} = 4.0 \times 10^9$ M⁻¹s⁻¹ in aqueous solutions (Haag & Yao 1992)

k_{OH} (calc) = 0.44×10^{-12} cm³ molecule⁻¹ s⁻¹ (molecular orbital calculations, Klamt 1993).

Hydrolysis: not environmentally significant (Mabey et al. 1982);

base rate constant $k < 0.9$ M⁻¹ h⁻¹ at 25°C with a calculated $t_{1/2} > 900$ yr at pH 7, based on assumed bases mediated 1% disappearance after 16 d at 85°C and pH 9.70 (Ellington et al. 1988)

first order $t_{1/2} > 879$ yr, based on rate constant $k < 0.9$ M⁻¹ h⁻¹ extrapolated to pH 7 at 25°C from 1% disappearance after 16 d at 85°C and pH 9.7 (Howard et al. 1991).

Biodegradation:

$k = 1.09 \times 10^{-2}$ h⁻¹ degradation in water (Verschuereen 1977)

$t_{1/2}$ (aq. aerobic) = 672–4320 h, based on unacclimated aerobic screening test data (Canton et al. 1985) and aerobic soil grab sample data (Haider et al. 1981; Howard et al. 1991)

$k = 0.05$ d⁻¹, significant degradation in aerobic environment (Tabak et al. 1981; Mills et al. 1982)

$t_{1/2}$ (aq. anaerobic) = 2688–17280 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: 1×10^{-10} mL cell⁻¹ h⁻¹ (estimated, Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 5.67$ h⁻¹; $k_2 = 0.0264$ h⁻¹ (trout muscle, Neely et al. 1974; Neely 1979)

$k_1 = 7.44$ h⁻¹ (10°C, yellow perch, Neely et al. 1974; Neely 1979)

$k_1 = 17.0$ h⁻¹ (25°C, yellow perch, Neely et al. 1974; Neely 1979)

$kk_1 = 1800$ d⁻¹; $k_2 = 1.00$ d⁻¹ (guppy, Könemann & van Leeuwen 1980)

$k_1 = 4.1$ h⁻¹; $1/k_2 = 24$ h (guppy, quoted from Könemann & van Leeuwen 1980, Hawker & Connell 1985)

$k_1 = 5.7$ h⁻¹; $1/k_2 = 38$ h (rainbow trout, quoted from Neely et al. 1974, Hawker & Connell 1985)

$k_1 = 97$ d⁻¹ (fish, quoted, Opperhuizen 1986)

$\log k_2 = 0, -0.2$ d⁻¹ (fish, calculated- K_{OW} , Thomann 1989)

$\log k_1 = 1.99$ d⁻¹; $\log k_2 = 0.0$ (guppy, 12–31 d exposure experiments, Gobas et al. 1989)

$\log k_1 = 1.99$ d⁻¹ (fish, quoted, Connell & Hawker 1988)

$k_1 = 291$ d⁻¹, 4230 d⁻¹; $k_2 = 0.98$ d⁻¹, 1.18 d⁻¹ (American flagfish: whole fish, fish lipid, Smith et al. 1990)

$k_2 = 0.98 \text{ d}^{-1}$, 1.46 d^{-1} (American flagfish: bioconcentration exptl., toxicity data, Smith et al. 1990)

$k_1 = 760 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 4.80 \text{ d}^{-1}$ (guppy, 96-h exposure, Sijm et al. 1993)

$k_1 = 600 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 2.50 \text{ d}^{-1}$ (fathead minnow, 96-h exposure, Sijm et al. 1993)

Half-Lives in the Environment:

Air: residence time of 38.6 d, loss of 2.6% in one day or 12 sunlit hours at 300 K in urban environments (Singh et al. 1981)

$t_{1/2} = 200.6\text{--}2006 \text{ h}$, based on photooxidation half-life in air (Howard et al. 1991)

Surface Water:

$t_{1/2} = 1.1\text{--}26 \text{ d}$, various locations in the Netherlands in case of a first order reduction process may be assumed (estimated, Zoeteman et al. 1980);

half-lives from marine mesocosm: $t_{1/2} = 18 \text{ d}$ in the spring at $8\text{--}16^\circ\text{C}$, $t_{1/2} = 10 \text{ d}$ in the summer at $20\text{--}22^\circ\text{C}$ and $t_{1/2} = 31 \text{ d}$ in the winter at $3\text{--}7^\circ\text{C}$ when volatilization dominates, and $t_{1/2} = 10.6 \text{ d}$ and 11 d for experiments with and without HgCl_2 , respectively, in September 9–15 (Wakeham et al. 1983);

hydrolysis $t_{1/2} > 900 \text{ yr}$ at pH 7 and 25°C (Ellington et al. 1988)

$t_{1/2}(\text{aerobic}) = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic screening test data and aerobic soil grab sample data; $t_{1/2}(\text{anaerobic}) = 2688\text{--}17280 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

photolysis $t_{1/2} = 25 \text{ d}$ under sunlight in water (Mansour & Feicht 1994).

Groundwater: $t_{1/2} \sim 1 \text{ yr}$ estimated from observed persistence in groundwater of the Netherlands (Zoeteman et al. 1981)

$t_{1/2} = 1344\text{--}8640 \text{ h}$, based on aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic screening test data and aerobic soil grab sample data (Howard et al. 1991).

Biota: $t_{1/2} < 1 \text{ d}$ in fish tissues (Veith et al. 1980);

$t_{1/2} < 1 \text{ d}$ in bluegill sunfish (Barrows et al. 1980);

$t_{1/2} = 16 \text{ h}$, clearance from fish (Neely 1980);

$t_{1/2} < 5 \text{ d}$ in worms at 8°C (Oliver 1987a);

biological half-lives, $t_{1/2} < 1 \text{ d}$ in trout muscle, $t_{1/2} < 1 \text{ d}$ in sunfish and $t_{1/2} < 1 \text{ d}$ in guppy for dichlorobenzenes (Niimi 1987);

depuration $t_{1/2} = 0.70 \text{ d}$ for whole fish, $t_{1/2} = 0.59 \text{ d}$ for fish lipid (American flagfish, Smith et al. 1990).

FIGURE 6.1.1.4.3 Logarithm of Henry's law constant, K_{OW} and K_{OA} versus reciprocal temperature for 1,4-dichlorobenzene.

6.1.1.5 1,2,3-Trichlorobenzene

Common Name: 1,2,3-Trichlorobenzene

Synonym: vic-trichlorobenzene

Chemical Name: 1,2,3-trichlorobenzene

CAS Registry No: 81-61-6

Molecular Formula: $C_6H_3Cl_3$

Molecular Weight: 181.447

Melting Point ($^{\circ}C$):

51.3 (Lide 2003)

Boiling Point ($^{\circ}C$):

218.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.4533 ($40^{\circ}C$, Weast 1972–73; Horvath 1982)

1.4533 ($25^{\circ}C$, Lide 2003)

1.69 (Dean 1985, 1992)

Molar Volume (cm^3/mol):

124.9 ($25^{\circ}C$, calculated-density)

158.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.364 (Tsonopoulos & Prausnitz 1971)

17.99 (Miller et al. 1984)

17.153 (Ruelle et al. 1993)

20.50 (Ruelle & Kesselring 1997; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

53.14 (Tsonopoulos & Prausnitz 1971)

56.90 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.552 (mp at $51.3^{\circ}C$)

0.53 ($25^{\circ}C$, mp at $53^{\circ}C$, Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

25.1 (Tsonopoulos & Prausnitz 1971)

31.5 (shake flask-UV, Yalkowsky et al. 1979, 1983)

16.6 (shake flask-GC, Mackay & Shiu 1981)

12.0 (shake flask-GC, Könemann 1981)

31.6 (recommended, Horvath 1982)

12.27 (generator column-GC/ECD, Miller et al. 1984, 1985)

18.0 (shake flask-HPLC, Banerjee 1984)

16.3 ($23^{\circ}C$, shake flask-GC, Chiou 1985)

18.0 (shake flask-GC, Chiou et al. 1986; Chiou et al. 1991)

$19.3^* \pm 0.24$; 23.7 ± 1.3 (generator column-GC/ECD; shake flask-GC/ECD, measured range 5 – $45^{\circ}C$, Shiu et al. 1997)

13.0 (shake flask-GC, Boyd et al. 1998)

$\ln x = -1.773 - 3418.9/(T/K)$, temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

19.71, 14.8, 21.04, 40.25 (5, 15, 25, $35^{\circ}C$, estimated- RP-HPLC- k' correlation, Finizio & Di Guardo 2001)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* ($40^{\circ}C$, summary of literature data, Stull 1947)

- 52.4 (extrapolated-Antoine eq., supercooled liquid P_L , Weast 1972–73)
 $\log (P/\text{mmHg}) = [-0.2185 \times 11349.5/(T/K)] + 7.91649$; temp range 40–218.5°C (Antoine eq., Weast 1972–73)
 28.0 (selected-converted from reported P_L , with fugacity ratio, Mackay & Shiu 1981)
 25.1 (gas saturation-GC, interpolated from reported graph, Rordorf 1985)
 17.7 (interpolated-Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_S/\text{kPa}) = 9.787 - 3440/(T/K)$; temp range 289–303 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 7.23008 - 2624.09/(10.506 + T/K)$; temp range 343–492 K, (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)
 11.20* (gas saturation-GC, measured range –15 to 40°C, Liu & Dickhut 1994)
 8.82* (20.35°C, static method-pressure gauge measurement; Antoine eq., measured range 0.36–169°C, Polednicek et al. 1996)
 $\ln (P_S/\text{Pa}) = 33.2977 - 9327.37/[(T/K) + 6.13445]$; temp range 272–3 (Antoine eq. from exptl data, pressure gauge measurement, solid, Polednicek et al. 1996)
 $\ln (P_L/\text{Pa}) = 21.1681 - 4077.21/[(T/K) - 71.6539]$; temp range 334–2 K (Antoine eq. from exptl data, pressure gauge measurement, liquid, Polednicek et al. 1996)
 44.1 (supercooled liquid P_L , GC-Kováš retention indices correlation; Spijksma et al. 1994)
 8.50* (20°C, recommended, summary of literature data, temp range 233.15–503.15 K, Roháč et al. 1999)
 $\ln [(P_S/\text{Pa})/173.0] = [1 - (T/K)/325.6] \cdot \exp\{3.380608 - 2.5802866 \times 10^{-4} \cdot (T/K)\}$; temp range 273–323 K (Cox eq., solid, recommended, Roháč et al. 1999)
 $\ln [(P_L/\text{Pa})/173.0] = [1 - (T/K)/325.6] \cdot \exp\{3.274398 - 1.0923018 \times 10^{-3} \cdot (T/K) + 7.8603029 \times 10^{-7} \cdot (T/K)^2\}$; temp range 333–448 K (Cox eq., liquid, recommended, Roháč et al. 1999)
 $\log (P/\text{kPa}) = 9.787 - 3440/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated):

- 127 (gas stripping-GC, Mackay & Shiu 1981)
 90.0 (gas stripping-GC, Oliver 1985)
 72.0 (20°C, gas stripping-GC, ten Hulscher et al. 1992)
 147 (equilibrium air stripping-GC, Shiu & Mackay 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 4.27 (Leo et al. 1971; Hansch & Leo 1979)
 4.11, 3.99 (shake flask-GC, HPLC- k' correlation, Könemann et al. 1979)
 4.02 (HPLC- k' correlation, McDuffie 1981)
 3.97 (shake flask-GC, Watarai et al. 1982)
 3.96 (HPLC- k' correlation, Hammers et al. 1982)
 4.04 (generator column-GC, Miller et al. 1984, 1985)
 4.14 (shake flask-GC, Chiou 1985)
 4.14 (shake flask-GC, Pereira et al. 1988)
 4.139 (shake flask/slow stirring-GC, De Bruijn et al. 1989)
 4.05 (recommended, Sangster 1993)
 4.14 (recommended, Hansch et al. 1995)
 3.81* (estimated- RP-HPLC- k' correlation, measured range 5–35°C, Finizio & Di Guardo 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 5.19*, 5.11 (generator column-GC, measured range –10 to 20°C; calculated, Harner & Mackay 1995)
 6.491, 6.073, 5.699, 5.385 (–10, 0, 9.88, 19.85°C, generator column-GC, Harner & Mackay 1995)
 $\log K_{OA} = -4.6 + 20 - 8.7/(T/K)$; $\Delta H_{OA} = 55.7 \text{ kJ/mol}$ (Harner & Mackay 1995)
 5.19 (calculated- S_{oct} and vapor pressure, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 4.11 (guppy, lipid basis, Könemann & van Leeuwen 1980)
 3.00–3.20 mean 3.08; 3.34–3.52 mean 3.41 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)

- 4.15–4.47 (rainbow trout, lipid basis, Oliver & Niimi 1983)
 3.08–3.42 (fish, Oliver 1984)
 4.35 (rainbow trout, hatching, 3.2% lipid, wet wt basis, lipid basis, Geyer et al. 1985)
 4.11 (guppy, 5.4% lipid, wet wt basis, Geyer et al. 1985)
 4.11 (guppy, lipid weight base, 12 to 31-d exposure studies, Gobas et al. 1987, 1989)
 2.85 (fish, calculated-concentration ratio C_B/C_W or rate constant ratio k_1/k_2 , Connell & Hawker 1988)
 3.28 (guppy, Van Hoogan & Opperhuizen 1988)
 4.76, 4.90, 3.54, 4.68 (field data-lipid based: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 3.30 (guppy, steady-state conditions, rate const. ratio k_1/k_2 , 96-h exposure, Sijm et al. 1993)
 4.50 (guppy, lipid normalized BCF, Sijm et al. 1993)
 2.99 (*Scenedesmus spp. Coenobia*, dry wt., batch adsorption, Koelmans et al. 1993)
 2.90, 3.28; 3.08, 3.41 (*Poecilla reticulata*; *Oncorhynchus mykiss*, quoted lit., flow through conditions, Devillers et al. 1996)
 2.94–3.23 (pond snail *Lymnaea stagnalis*, lipid wt basis, lipid content 0.5%, Legierse et al. 1998)
 3.08, 4.16; 2.812, 3.055 (quoted: whole fish, lipid content; calculated- MCI χ , K_{OW} , Lu et al. 1999)
 3.68; 3.72 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 2.85 (river sediment, 0.56% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
 2.73–4.00 (five soils, 0.04–0.73% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
 4.70; 4.10 (field data of Lake Ontario sediment trap material; Niagara River-organic matter, Oliver & Charlton 1984)
 3.0, 2.0 (Sanhedron soil humic acid, Suwannee River humic acid, batch equilibrium-sorption isotherm, GC/ECD, Chiou et al. 1986)
 2.3, 2.0 (Sanhedron soil fulvic acid, Suwannee River fulvic acid, batch equilibrium-sorption isotherm, GC/ECD, Chiou et al. 1986)
 3.21, 3, 14 (Riddles soil: top layer 1.84% OC; below top layer, batch equilibrium-sorption isotherm, Boyd et al. 1990)
 3.18, 3.38, 3.43, 3.26, 3.23 (five soils: clay loam/kaolinite, light clay/montmorillonite, light clay/montmorillite, sandy loam/allophane, clay loam/allophane, batch equilibrium-sorption isotherm, Kishi et al. 1990)
 3.91 (Isora soil 1.87% OC, batch equilibrium, GC, Paya-Perez et al. 1991)
 3.81 (lake sediment 2.5% OC, batch equilibrium, Schrap et al. 1994)
 3.61 \pm 0.39 (suspended particulates in coastal waters, Masunaga et al. 1996)
 3.16 (HPLC-screening method; Müller & Kördel 1996)
 3.48, 3.37 (soils: organic carbon OC \geq 0.1%, OC \geq 0.5%, average, Delle Site 2001)

Environment Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} \sim 1.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 116 d, loss of 0.9% in one day or 12 sunlit hours at 300 K for trichlorobenzenes in urban environments (Singh et al. 1981)

$k(aq.) \leq 0.06 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 3 and 21°C, with $t_{1/2} > 6 \text{ d}$ at pH 7 (Yao & Haag 1991).

$k_{HO}(\text{calc}) = 4.0 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ in aqueous solutions (Haag & Yao 1992)

Hydrolysis: base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C with a calculated $t_{1/2} > 900 \text{ yr}$ at pH 7 (Ellington et al. 1988)

Biodegradation: dechlorination pseudo-first order rate constant $k = 0.387 \text{ d}^{-1}$ with $t_{1/2} = 1.8 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 8300 \text{ d}^{-1}$; $k_2 = 0.45 \text{ d}^{-1}$ (guppy, exptl., Könemann & van Leeuwen 1980)

$k_2 = 0.45 \text{ d}^{-1}$ (guppy, exptl., Könemann & van Leeuwen 1980)

$k_1 = 18.7 \text{ h}^{-1}$; $1/k_2 = 53 \text{ h}$ (guppy, quoted, Hawker & Connell 1985)
 $\log k_1 = 2.50 \text{ d}^{-1}$; $\log k_2 = -0.35 \text{ d}^{-1}$ (guppy, 12 to 31-d exposure studies, Gobas et al. 1989)
 $k_1 = 780 \text{ mL g}^{-1} \cdot \text{d}^{-1}$; $k_2 = 0.42 \text{ d}^{-1}$ (guppy, Van Hoogan & Opperhuizen 1988)
 $k_1 = 780 \pm 220 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.42 \pm 0.06 \text{ d}^{-1}$ (guppy, 96-h exposure studies, Sijm et al. 1993)
 $k_1 = (23\text{--}29) \text{ mL g}^{-1} \text{ d}^{-1}$, $k_2 = (5\text{--}3) \text{ d}^{-1}$ (pond snail *Lymnaea stagnalis*, Legierse et al. 1998)

Half-Lives in the Environment:

Air: residence time of 116 d, loss of 0.9% in one day or 12 sunlit hour at 300 K for trichlorobenzenes in urban environments (Singh et al. 1981)

Surface Water: $t_{1/2} = 1.9\text{--}30 \text{ d}$, surface waters in various locations in the Netherlands in case of first order reduction process may be assumed (estimated, Zoeteman et al. 1980)

hydrolysis $t_{1/2} > 900 \text{ yr}$ at pH 7 and 25°C (Ellington et al. 1988)

$k(\text{exptl}) \leq 0.006 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2 and 21°C, with $t_{1/2} > 6 \text{ d}$ at pH 7 (Yao & Haag 1991)

Groundwater:

Sediment: dechlorination $t_{1/2} = 1.8 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Soil:

Biota: biological $t_{1/2} < 1 \text{ d}$ in trout, $t_{1/2} = 2 \text{ d}$ in sunfish and $t_{1/2} = 2 \text{ d}$ in guppy for trichlorobenzenes (Niimi 1987)
 $t_{1/2} < 5 \text{ d}$ in worm at 8°C (Oliver 1987a).

TABLE 6.1.1.5.1

Reported aqueous solubilities, octanol-water partition coefficients and octanol-air partition coefficients of 1,2,3-trichlorobenzene at various temperatures

FIGURE 6.1.1.5.2 Logarithm of vapor pressure versus reciprocal temperature for 1,2,3-trichlorobenzene.

6.1.1.6 1,2,4-Trichlorobenzene

Common Name: 1,2,4-Trichlorobenzene

Synonym: unsym-trichlorobenzene

Chemical Name: 1,2,4-trichlorobenzene

CAS Registry No: 120-82-1

Molecular Formula: $C_6H_3Cl_3$

Molecular Weight: 181.447

Melting Point ($^{\circ}C$):

16.92 (Lide 2003)

Boiling Point ($^{\circ}C$):

213.5 (Weast 1972–73; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.4542 (Weast 1972–73)

1.446 (Dean 1985, 1992)

1.459 (Lide 2003)

Molar Volume (cm^3/mol):

124.8 ($20^{\circ}C$, calculated-density)

158.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.48 (Tsonopoulos & Prausnitz 1971)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

53.56 (Tsonopoulos & Prausnitz 1971)

Fugacity Ratio, at $25^{\circ}C$, F: 1.0 (Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

25.03 (Irmann 1965)

34.7 (shake flask-UV, Yalkowsky et al. 1979)

30.0 (Callahan et al. 1979)

19.4 (shake flask-GC, Könemann 1981)

30.0 (recommended, Hovarth 1982)

48.8 ($20^{\circ}C$, shake flask-GC, Chiou & Schmedding 1981; Chiou et al. 1982; 1983)

46.1 (generator column-GC/ECD, Miller et al. 1984; 1985)

31.3 (shake flask-HPLC/UV, Banerjee 1984)

30.9 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

34.6 (shake flask-GC, Chiou 1985)

52.0 (shake flask-GC, Boyd et al. 1998)

36.5 ± 0.36 (shake flask-GC/FID, measured range 5 – $45^{\circ}C$, Ma et al. 2001)

7.71, 10.39, 13.58, 19.82 (5, 15, 25, $35^{\circ}C$, estimated- RP-HPLC- k' correlation, Finizio & Di Guardo 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* ($38.4^{\circ}C$, summary of literature data, temp range 38.4 – $213^{\circ}C$, Stull 1947)

38.6 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 7.19608 - 1827.0/(210.0 + t/^{\circ}C)$; temp range 110 – $280^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

60.6 (extrapolated-Antoine eq., supercooled liquid, Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 11425.1/(T/K)] + 8.030523$; temp range 38.4 – $213^{\circ}C$ (Antoine eq., Weast 1972–73)

- 26.4 (gas saturation, Politzki et al. 1982)
 28.5 (gas saturation-GC, interpolated from reported graph, Rordorf 1985)
 38.7 (interpolated-Antoine eq.-III, Stephenson & Malanowski 1987)
 $\log (P_g/\text{kPa}) = 9.570 - 3254/(T/K)$; temp range 279–290 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.31998 - 1827/(-63.15 + T/K)$; temp range 383–553 K (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.6802 - 2064.4/(-43.05 + T/K)$; temp range 293–383 K (liquid, Antoine eq.-III, Stephenson & Malanowski 1987)
 53.4 (supercooled liquid P_L , GC-Kovács retention indices correlation; Spijksma et al. 1994)
 $\log (P/\text{mmHg}) = 15.5947 - 2.8920 \times 10^3/(T/K) - 2.5549 \cdot \log (T/K) + 2.0384 \times 10^{-4} \cdot (T/K) - 7.0601 \times 10^{-14} \cdot (T/K)^2$, temp range 290–725 K, (Yaws 1994)
 5728* (118.671°C, comparative ebulliometry, measured range 118.671–215.887°C, Roháč et al. 1998)
 24.2* (20°C, recommended, summary of literature data, temp range 293.15–493.15 K, Roháč et al. 1999)
 $\ln [(P/\text{Pa})/19.0] = [1 - (T/K)/290.07] \cdot \exp\{3.352607 - 9.0343639 \times 10^{-4} \cdot (T/K) + 6.0501757 \times 10^{-7} \cdot (T/K)^2\}$; temp range 294–489 K (Cox eq., recommended, Roháč et al. 1999)
 $\log (P/\text{kPa}) = 9.570 - 3254/(T/K)$; temp range 6–17°C (solid, regression eq. from literature data, Shiu & Ma 2000)
 $\log (P/\text{kPa}) = 6.682 - 2064.4/[(T/K) - 43.5]$; temp range 20–110°C (liquid, regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

- 122 (gas stripping-GC, Oliver 1985)
 144 (gas stripping-GC, Warner et al. 1987)
 195* (EPICS-GC/FID, measured range 10–30°C, Ashworth et al. 1988)
 $\ln [H/(\text{atm} \cdot \text{m}^3/\text{mol})] = -16.34 + 3307/(T/K)$; temp range 10–30°C (EPICS-GC/FID, Ashworth et al. 1988)
 101 (gas stripping-GC, ten Hulscher et al. 1992)
 375.2 (modified EPICS method-GC, Ryu & Park 1999)
 172 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 4.381 - 1622/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 4.05 (Leo et al. 1971)
 4.26 (Callahan et al. 1979)
 4.02 (Hansch & Leo 1979; Hansch & Leo 1985)
 3.93 (shake flask-GC, HPLC-k' correlation, Könemann et al. 1979)
 4.02 (20°C, shake flask-GC, Chiou & Schmedding 1981; Chiou et al. 1982; Chiou 1985)
 3.97 (shake flask-GC, Watarai et al. 1982)
 3.96 (HPLC-k' correlation, Hammers et al. 1982)
 3.93–4.18, 4.09 (range, mean, shake flask method, Eadsforth & Moser 1983)
 4.12–4.32, 4.21 (range, mean, HPLC method, Eadsforth & Moser 1983)
 3.98 (generator column-GC/ECD, Miller et al. 1984; 1985)
 4.22 (HPLC-k' correlation, De Kock & Lord 1987)
 4.02 (shake flask-GC, Pereira et al. 1988)
 4.05 (slow stirring-GC, De Bruijn et al. 1989)
 4.02 (recommended, Sangster 1993)
 4.02 (recommended, Hansch et al. 1995)
 3.92* (estimated- RP-HPLC-k' correlation, measured range 5–35°C, Finizio & Di Guardo 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.

- 5.10* (20°C, HPLC-k' correlation, measured range 10–50°C, Su et al. 2002)
 $\log K_{OA} = 62080/(2.303 \cdot RT) - 6.031$; temp range 10–50°C (HPLC-k' correlation, Su et al. 2002)

Bioconcentration Factor, log BCF at 25°C or as indicated:

- 3.32 (fathead minnow, 32-d exposure, Veith et al. 1979b)
- 3.45; 3.37; 2.95 (fathead minnow; green sunfish; rainbow trout, Veith et al. 1979b)
- 2.69 (fish, flowing water, Kenaga & Goring 1980; Kenaga 1980a)
- 2.26 (bluegill sunfish, whole body, flow system, Barrows et al. 1980)
- 3.52 (microorganism-water, Mabey et al. 1982)
- 3.04–3.11 mean 3.11; 3.43–3.60 mean 3.51 (rainbow trout, 15°C, steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
- 4.19–4.56 (rainbow trout, lipid base, Oliver & Niimi 1983)
- 3.26–3.61 (fish, Oliver 1984, 1985)
- 2.40 (algae, Geyer et al. 1984)
- 3.15 (activated sludge, Freitag et al. 1984; Halfon & Reggiani 1986)
- 2.40, 2.69, 3.15 (algae, fish, sludge, Klein et al. 1984)
- 3.15–3.72 mean 3.36; 3.30–3.75 mean 3.57 (rainbow trout, wet wt. basis, 15°C, steady-state BCF on 7- to 96-d laboratory study in two tanks of different water concn, Oliver & Niimi 1985)
- 3.11; 3.08 (rainbow trout, wet wt. basis, laboratory data; Lake Ontario field data, Oliver & Niimi 1985)
- 4.19–4.56 (rainbow trout, lipid base, Oliver & Niimi 1985)
- 2.09; 3.84 (quoted, rainbow trout, 1.8% lipid, wet wt basis, lipid basis, Geyer et al. 1985)
- 2.28, 2.40, 2.34, 2.66 (quoted, carp, 2.2% lipid, wet wt basis, Geyer et al. 1985)
- 3.94, 3.96, 4.0, 4.32 (quoted, carp, 2.2% lipid, lipid basis, Geyer et al. 1985)
- 2.54; 4.04 (quoted, rainbow trout, hatching, 3.2% lipid, wet wt basis, lipid basis, Geyer et al. 1985)
- 2.66, 2.73; 4.02, 4.09 (quoted, carp, 4.4% lipid, wet wt basis, lipid basis, Geyer et al. 1985)
- 2.96; 4.26 (quoted, golden ide, 5.0% lipid, wet wt basis, lipid basis, Geyer et al. 1985)
- 2.86, 2.94; 4.15, 4.19 (quoted, zebra fish, 5.2% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
- 2.83, 3.12; 4.12, 4.22 (quoted, tilapia, 5.2% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
- 2.98, 3.12; 4.23, 4.36 (quoted, bluegill sunfish, 5.7% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
- 3.13, 3.14; 4.37, 4.38 (quoted, guppy, 5.8% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
- 3.11, 3.20; 4.23, 4.38 (quoted, rainbow trout, 7.7%, wet wt basis; lipid basis, Geyer et al. 1985)
- 2.96, 3.03; 4.05, 4.23 (quoted, guppy, 8.2% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
- 3.11; 4.19 (quoted, rainbow trout, 8.3% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
- 3.32; 4.30 (quoted, fathead minnow, 10.5% lipid, wet wt basis, lipid basis Geyer et al. 1985)
- 2.69; 2.40; 3.15 (fish; algae; activated sludge, Freitag et al. 1985)
- 2.61 (fathead minnow, Carlson & Kosian 1987)
- 4.76, 4.90, 3.54, 4.68 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
- 3.31, 4.25 (American flagfish, whole fish, fish lipid, Smith et al. 1990)
- 2.95–3.57; 3.31; 3.32; 3.36 (*Oncorhynchus mykiss*; *Jordanella floridae*; *Pimephales promelas*; *Lepomis cyanellus*, quoted lit., flow through conditions, Devillers et al. 1996)
- 3.0, 3.06, 3.06 (guppy: k_1/k_2 -best fit exptl. data, k_1/k_2 -slope method, C_f/C_w -steady state, van Eck et al. 1997)
- 3.81; 3.89 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{oc} :

- 2.80 (river sediment, 0.56% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
- 2.68–3.94 (5 soils, 0.04–0.73% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
- 4.70; 4.40 (field data of sediment trap material; Niagara River-organic matter; Oliver & Charlton 1984)
- 4.3–5.1, 5.10; 5.10 (suspended sediment, average; algae > 50 μ m, Oliver 1987c)
- 4.8–5.3, 5.0 (Niagara River plume, range, mean, Oliver 1987b)
- 3.91 (untreated Marlette soil A horizon, organic carbon OC 2.59%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 3.66, 3.40 (organic cations treated Marlette soil A horizon: HDTMA treated OC 6.48%; DDTMA treated, OC 4.37%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 3.27 (untreated Marlette soil B₁ horizon, 0.30% OC, equilibrium isotherm, Lee et al. 1989)

- 3.91, 3.64, 3.04 (organic cations treated Marlette soil B_t horizon: HDTMA treated OC 3.72%, DDTMA treated OC 1.98%, NTMA treated, OC 1.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 3.32 (calculated- K_{OW} , Aldrich or Fluka humic acid polymers, Chin & Weber 1989)
- 3.32; 2.62 (Aldrich humic acid, organic polymers, Chin et al. 1990)
- 4.02 (Ispra soil, shake flask-GC, Paya-Perez et al. 1991)
- 2.71, 2.71 (RP-HPLC- k' correlation including: MCI-related to non-dispersive intermolecular interactions, hydrogen-bonding indicator variable, Hong et al. 1996)
- 3.86 \pm 0.40 (suspended particulates in coastal waters, Masunaga et al. 1996)
- 3.15, 3.19, 3.10 (soils: organic carbon OC \geq 0.1%, OC \geq 0.5%, 0.1 \leq OC < 0.5%, average, Delle Site 2001)
- 4.38–3.24 (NIST SRM diesel particulate matter, sorption isotherm, Ngyuen et al. 2004)

Sorption Partition Coefficient, log K_{OM} :

- 2.70 (Woodburn silt loam soil, 1.9% organic matter, equilibrium sorption isotherm, Chiou et al. 1983)
- 2.89 (untreated Marlette soil A horizon, organic matter OM 5.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 3.47, 3.17 (organic cations treated Marlette soil A horizon: HDTMA treated, organic matter 10.03%; DDTMA treated, OM 5.18%, batch equilibrium-adsorption isotherm, Lee et al. 1989)
- 2.97 (untreated Marlette soil B_t horizon, 0.30% OC, equilibrium sorption isotherm, Lee et al. 1989)
- 3.97, 3.50, 2.87 (organic cations treated Marlette soil B_t horizon: HDTMA treated OM 4.85%, DDTMA treated OM 2.73%, NTMA treated, OM 1.74%, batch equilibrium-adsorption isotherm, Lee et al. 1989)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: rate constants: $k = 0.032 \text{ d}^{-1}$ with $t_{1/2} = 22 \text{ d}$ in spring at 8–16°C, $k = 0.066 \text{ d}^{-1}$ with $t_{1/2} = 11 \text{ d}$ in summer at 20–22°C, $k = 0.058 \text{ d}^{-1}$ with $t_{1/2} = 12 \text{ d}$ in winter at 3–7°C for the periods when volatilization appears to dominate, and $k = 0.073 \text{ d}^{-1}$ with $t_{1/2} = 9.5 \text{ d}$ with HgCl_2 , and $k = 0.066 \text{ d}^{-1}$ with $t_{1/2} = 10.6 \text{ d}$ without HgCl_2 in September 9–15, in marine mesocosm experiments (Wakeham et al. 1983)

Photolysis: not environmentally relevant (Mabey et al. 1982)

$t_{1/2} = 450 \text{ yr}$ for surface water photolysis at 40°N latitude in the summer (Dulin et al. 1986)

$k = 1.16 \times 10^{-3} \text{ h}^{-1}$ with H_2O_2 at 25°C in F-113 solution and with HO \cdot in the gas (Dilling et al. 1988)

$k = 0.03 \text{ h}^{-1}$, the maximum summer photolysis rate calculated at midday clear sky, the minimum photolytic $t_{1/2} \sim 4 \text{ months}$, but a realistic value is likely to be at least 1 yr (Bunce et al. 1989)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k = 7.22 \times 10^{-3} \text{ h}^{-1}$ (Simmons et al. 1976; selected, Mackay et al. 1985)

$k_{OH} \sim 1.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 116 d, loss of 0.9% in one day or 12 sunlit hours at 300 K for trichlorobenzenes in urban environments (Singh et al. 1981)

$k(\text{singlet oxygen}) \ll 360 \text{ M}^{-1} \text{ h}^{-1}$; $k(\text{RO}_2 \text{ radical}) \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ (Mabey et al. 1982)

$k \ll 1.6 \text{ M}^{-1} \text{ s}^{-1}$ for the reaction with ozone in water using 10 mM *t*-BuOH as scavenger at pH 2 and 20–23°C (Hoigné & Bader 1983)

$k_{OH} = 5.32 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 273–368 K (flash photolysis-resonance fluorescence, Rinke & Zetzsch 1984)

$k_{OH}(\text{obs.}) = 5.32 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; and $k_{OH}(\text{calc}) = 3.47 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{OH}(\text{calc}) = 0.29 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs}) = 0.532 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}(\text{aq.}) = 4.0 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ in aqueous solutions (Haag & Yao 1992)

$k_{OH}(\text{calc}) = 0.34 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis: not environmentally significant (Mabey et al. 1982);

base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C with a calculated $t_{1/2} > 900 \text{ yr}$ at pH 7 (Ellington et al. 1988)

first-order rate constant $k = 2.3 \times 10^{-5} \text{ h}^{-1}$ with $t_{1/2} = 3.4 \text{ yr}$ at pH 7 and 25°C (Howard et al. 1991).

Biodegradation: $k = 1.92 \times 10^{-2} \text{ h}^{-1}$, degradation in water (Simmons et al. 1976)

$t_{1/2}(\text{aq. aerobic}) = 672\text{--}4320 \text{ h}$ estimated from unacclimated soil grab sample data (Howard et al. 1991)

$t_{1/2}(\text{aq. anaerobic}) = 2688\text{--}17280 \text{ h}$ based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$k = 0.05 \text{ d}^{-1}$, significant degradation in an aerobic environment (Tabak et al. 1981; Mills 1982)

$k = 0.029 \text{ d}^{-1}$ in river water, $k = 0.026 \text{ d}^{-1}$ in estuarine water, and $k = 0.012 \text{ d}^{-1}$ in marine water (Bartholomew & Pfaender 1983; Battersby 1990)

$t_{1/2}(\text{aerobic}) = 28 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 110 \text{ d}$ in natural waters (Capel & Larson 1995)

$k = 0.035 \text{ d}^{-1}$, the dechlorination pseudo-first order rate constant, with $t_{1/2} = 19.8 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000)

Biotransformation: $1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ (estimated, Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 8300 \text{ d}^{-1}$; $k_2 = 0.45 \text{ d}^{-1}$ (guppy, exptl., Könemann & Van Leeuwen 1980)

$k_1 = 18.7 \text{ h}^{-1}$; $1/k_2 = 53.0 \text{ h}$ (guppy, selected, Hawker & Connell 1985)

$\log k_1 = 2.65 \text{ d}^{-1}$; $\log 1/k_2 = 0.34 \text{ d}$ (guppy, selected, Connell & Hawker 1988)

$\log k_2 = -1.85 \text{ d}^{-1}$; $\log k_2 = 0.23 \text{ d}^{-1}$ (fish, calculated- K_{ow} , fast-biphasic, Thomann 1989)

$k_1 = 1158 \text{ d}^{-1}$, 10140 d^{-1} ; $k_2 = 0.57 \text{ d}^{-1}$, 0.57 d^{-1} (American flagfish: whole fish, fish lipid, Smith et al. 1990)

$k_2 = 0.57 \text{ d}^{-1}$, 0.46 d^{-1} (American flagfish: bioconcentration data, toxicity data, Smith et al. 1990)

$k_1 = 492 \pm 234 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.49 \pm 0.22 \text{ d}^{-1}$ (guppy, exptl., van Eck et al. 1997)

Half-Lives in the Environment:

Air: residence time of 116 d, loss of 0.9% in one day or 12 sunlit hour at 300 K for trichlorobenzenes in urban environments (Singh et al. 1981)

calculated minimum photolytic $t_{1/2} \sim 4$ months, but realistically at least 1 yr (Bunce et al. 1989);

tropospheric lifetime of 25 d based on reaction principally with OH radical and other photochemical reactions (Bunce 1991);

$t_{1/2} = 128.4\text{--}1284 \text{ h}$, based on the photooxidation with OH radical (Howard et al. 1991).

Surface Water: $t_{1/2} = 2.1\text{--}28 \text{ d}$ estimated for various locations in the Netherlands, $t_{1/2} = 0.3\text{--}3 \text{ d}$ for river water, $t_{1/2} = 3\text{--}30 \text{ d}$ for lakes estimated from persistence (Zoeteman et al. 1980);

half-lives from marine mesocosm: $t_{1/2} = 22 \text{ d}$ in the spring at $8\text{--}16^\circ\text{C}$, $t_{1/2} = 11 \text{ d}$ in the summer at $20\text{--}22^\circ\text{C}$ and $t_{1/2} = 12 \text{ d}$ in the winter at $3\text{--}7^\circ\text{C}$ when volatilization dominates, and $t_{1/2} = 9.5 \text{ d}$ and 10.6 d for experiments with and without HgCl_2 respectively in September 9–15 (Wakeham et al. 1983)

hydrolysis $t_{1/2} > 900 \text{ yr}$ at pH 7 and 25°C (Ellington et al. 1988)

$t_{1/2}(\text{aerobic}) = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic soil grab sample data; $t_{1/2}(\text{anaerobic}) = 2688\text{--}17280 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life; and first order hydrolysis $t_{1/2} = 3.4 \text{ yr}$ (Howard et al. 1991);

$t_{1/2}(\text{aerobic}) = 28 \text{ d}$, $t_{1/2}(\text{anaerobic}) = 110 \text{ d}$ in natural waters (Capel & Larson 1995)

Groundwater: $t_{1/2} = 1344\text{--}8640 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

$t_{1/2} = 30\text{--}300 \text{ d}$ estimated from persistence (Zoeteman et al. 1980).

Soil: $t_{1/2} < 10 \text{ d}$ (Ryan et al. 1988)

$t_{1/2} = 672\text{--}4320 \text{ h}$, based on unacclimated aerobic soil grab sample data (Howard et al. 1991).

Sediment: dechlorination $t_{1/2} = 19.8 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biota: $1 < t_{1/2} < 3 \text{ d}$ in blue bluegill sunfish (Barrows et al. 1980);

biological half-lives, $t_{1/2} < 1 \text{ d}$ in trout, $t_{1/2} = 2 \text{ d}$ in sunfish, and $t_{1/2} = 2 \text{ d}$ in guppy for trichlorobenzenes (Niimi 1987);

$t_{1/2} < 5 \text{ d}$ in worms at 8°C (Oliver 1987a);

depuration $t_{1/2} = 1.21 \text{ d}$ from whole fish, $t_{1/2} = 1.20 \text{ d}$ from fish lipid (American flagfish, Smith et al. 1990).

6.1.1.7 1,3,5-Trichlorobenzene

Common Name: 1,3,5-Trichlorobenzene

Synonym: sym-trichlorobenzene

Chemical Name: 1,3,5-trichlorobenzene

CAS Registry No: 108-70-3

Molecular Formula: $C_6H_3Cl_3$

Molecular Weight: 181.447

Melting Point ($^{\circ}C$):

62.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

208.0 (Weast 1972–72, 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.3865 ($64^{\circ}C$, Weast 1972–73; Horvath 1982)

Molar Volume (cm^3/mol):

130.9 ($64^{\circ}C$, calculated-density)

125 (calculated-density, liquid molar volume, Chiou 1985)

158.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.622 (Tsonopoulos & Prausnitz 1971)

18.786 (Miller et al. 1984)

18.198 (Ruelle et al. 1993; Ruelle & Kesselring 1997; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

58.16 (Tsonopoulos & Prausnitz 1971)

56.07 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.426 (mp at $62.8^{\circ}C$)

0.413 ($25^{\circ}C$, Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

25.03 (Tsonopoulos & Prausnitz 1971)

6.59 (shake flask-UV, Yalkowsky et al. 1979)

5.87 (shake flask-GC, Könnemann 1981)

6.61 (recommended, Hovarth 1982)

4.12 (generator column-GC/ECD, Miller et al. 1984, 1985)

6.01 (shake flask-HPLC, Banerjee 1984)

10.6 (shake flask-GC, Chiou 1985)

6.53 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

$8.46^* \pm 0.26$ (generator column-GC/ECD, measured range 5 – $45^{\circ}C$, Shiu et al. 1997)

2.40 (shake flask-GC, Boyd et al. 1998)

$\ln x = -5.083768 - 2650.68/(T/K)$, temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

666.6* ($63.8^{\circ}C$, summary of literature data, temp range 63.8 – $208.4^{\circ}C$, Stull 1947)

77 (extrapolated-Antoine eq., supercooled liquid, Weast 1972–73)

$\log(P/mmHg) = [-0.2185 \times 11211.0/(T/K)] + 7.977218$; temp range 63.8 – $208.4^{\circ}C$ (Antoine eq., Weast 1972–73)

30.23 (gas saturation, interpolated from reported graph, Rordorf 1985)

24.4 (solid, extrapolated-Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 8.301 - 2956/(T/\text{K})$; temp range 282–301 K (solid, Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.43345 - 1932.26/(-45.268 + T/\text{K})$; temp range 336–482 K, (liquid, Antoine eq.-II, Stephenson & Malanowski 1987)

124.4 (GC-RT correlation, Watanabe & Tatsukawa 1989)

62.4; 74.9 (supercooled liquid P_L , GC-Kovács retention indices correlation; quoted lit., Spieksma et al. 1994)

$\log (P/\text{mmHg}) = 19.2854 - 4.4976 \times 10^3/(T/\text{K}) - 3.6158 \cdot \log (T/\text{K}) - 5.2495 \times 10^{-9} \cdot (T/\text{K}) + 1.5596 \times 10^{-6} \cdot (T/\text{K})^2$, temp range 398–748 K (Yaws 1994)

12.4, 20.44* (20.35°C pressure gauge measurement, 25°C interpolated from reported Antoine eq. based on exptl. data, Polednicek et al. 1996)

$\ln (P_s/\text{Pa}) = 32.5109 - 8909.70/[(T/\text{K}) + 3.94116]$; temp range 273–333 K (Antoine eq. from exptl data, pressure gauge measurement, solid, Polednicek et al. 1996)

$\ln (P_L/\text{Pa}) = 21.1215 - 3939.96/[(T/\text{K}) - 71.2907]$; temp range 343–442 K (Antoine eq. from exptl data, pressure gauge measurement, liquid, Polednicek et al. 1996)

12.5 (20°C, recommended, summary of literature data, temp range 233.15–483.15 K, Roháč et al. 1999)

$\ln [(P_s/\text{Pa})/565.0] = [1 - (T/\text{K})/337.0] \cdot \exp\{3.305508 - 2.3049477 \times 10^{-4} \cdot (T/\text{K})\}$; temp range 273–333 K (Cox eq., solid, recommended, Roháč et al. 1999)

$\ln [(P_L/\text{Pa})/547.0] = [1 - (T/\text{K})/336.6] \cdot \exp\{3.190854 - 1.0710853 \times 10^{-3} \cdot (T/\text{K}) + 7.5659237 \times 10^{-7} \cdot (T/\text{K})^2\}$; temp range 343–442 K (Cox eq., liquid, recommended, Roháč et al. 1999)

32.3* (29.33°C, static method-diaphragm manometer, measured range 29–142°C, Blok et al. 2001)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

192.5 (20°C, batch stripping-GC, Oliver 1985)

192 (gas stripping-GC/ECD, ten Hulscher et al. 1992)

Octanol/Water Partition Coefficient, $\log K_{ow}$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

4.02 (Leo et al. 1971; Hansch & Leo 1979)

4.15 (shake flask-GC, HPLC- k' correlation, Könemann et al. 1979)

4.17 (shake flask-GC, Watarai et al. 1982)

4.17 (HPLC- k' correlation, Hammers et al. 1982)

4.02 (generator column-GC/ECD, Miller et al. 1984; 1985)

4.18 (HPLC-RV correlation, Garst 1984)

4.31 (shake flask-GC, Chiou 1985)

4.49 (Hansch & Leo 1985)

4.32* (19°C, shake flask-GC/ECD, measured range 13–33°C, Opperhuizen et al. 1988)

4.31 (shake flask-GC, Pereira et al. 1988)

4.189 (slow stirring-GC, De Bruijn et al. 1989)

4.15 (recommended, Sangster 1993)

4.19 (recommended, Hansch et al. 1995)

4.34* ± 0.04 (shake flask-GC/ECD, Bahadur et al. 1997)

$\log K_{ow} = 1.1228 - 18200/[2.303 \cdot R(T/\text{K})]$; temp range 5–45°C (van't Hoff eq., Bahadur et al. 1997)

4.44 (RP-HPLC-RT correlation, short ODP column, Donovan & Pescatore 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated. Additional data at other temperatures designated

* are compiled at the end of this section:

4.85 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)

4.89* (20°C HPLC- k' correlation, measured range 10–50°C, Su et al. 2002)

$\log K_{OA} = 68550/(2.303 \cdot RT) - 7.368$; temp range 10–50°C (HPLC- k' correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$: at 25°C or as indicated

4.15 (guppy, lipid basis, Könemann & van Leeuwen 1980)

3.15–3.30 mean 3.26; 3.57–3.92 mean 3.61 (rainbow trout, 15°C, steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)

4.34–4.67 (rainbow trout, lipid basis, Oliver & Niimi 1983)

3.26–3.61 (fish, Oliver 1984)

- 4.15 (guppy, female, 5.4% lipid, wet wt basis; lipid basis, Geyer et al. 1985)
 2.39–2.55 (fish, normalized, Tadokoro & Tomita 1987)
 4.14 (guppy-lipid phase, Gobas et al. 1987, 1989)
 2.88 (fish, calculated- C_B/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)
 4.32, 4.35, 4.38, 4.43 (13, 19, 28, 33°C, female guppy, Opperhuizen et al. 1988)
 4.40, 4.45, 3.51, 4.22 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 3.26, 3.61; 3.48 (*Oncorhynchus mykiss*; *Poecilia reticula*, quoted lit., flow through conditions, Devillers et al. 1996)
 2.68 (pond snail *Lymnaea stagnalis*, lipid wt basis, lipid content 0.5%, Legierse et al. 1998)
 3.26, 4.33; 3.271, 2.884 (quoted: whole fish, lipid content; calculated-MCI χ , K_{OW} , Lu et al. 1999)
 3.69; 3.64 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 5.10; 4.20 (field data of Lake Ontario sediment trap material; Niagara River-organic matter; Oliver & Charlton 1984)
 2.85 (forest soil 0.2% OC, observed, Seip et al. 1986)
 4.13 (Ispra soil 1.87% OC, shake flask-GC, Paya-Perez et al. 1991)
 3.55 \pm 0.47 (suspended particulates in coastal waters, Masunaga et al. 1996)
 3.69 (soil: organic carbon OC \geq 0.1%, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 4.5$ h from a model river of 1 m depth with water current 1 m/s and wind velocity 3 m/s at 20°C (Lyman et al. 1982).

Photolysis: may be susceptible to direct photolysis by sunlight (Howard 1989)

$t_{1/2} \sim 450$ yr for sunlight photolysis at 40°N in the summer (Dulin et al. 1986)

$k = 0.003 \text{ min}^{-1}$, measured pseudo-first-order direct photolysis reaction with $t_{1/2} = (205.5 \pm 7.5) \text{ min}$ in aqueous solution (Peijnenburg et al. 1992)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} \sim 1.0 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, residence time of 116 d, loss of 0.9% in one day or 12 sunlit hours at 300 K for trichlorobenzenes in urban environments (Singh et al. 1981)

photooxidation $t_{1/2} = 6.17$ months, based on a measured rate for the vapor phase reaction with photochemically produced hydroxyl radicals in air (Atkinson et al. 1985).

Hydrolysis: will not hydrolyze under normal environmental conditions (Howard 1989).

Biodegradation: resistant to biodegradation (Tabak et al. 1964; Howard 1989);

dechlorination pseudo-first order rate constant $k = 0.069 \text{ d}^{-1}$ with $t_{1/2} = 10.1 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biotransformation:

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 8000 \text{ d}^{-1}$; $k_2 = 0.40 \text{ d}^{-1}$ (guppy, Könemann & van Leeuwen 1980)

$k_1 = 18.0 \text{ h}^{-1}$; $1/k_2 = 60 \text{ h}$ (guppy, quoted, Hawker & Connell 1985)

$k_1 = 430 \text{ d}^{-1}$ (fish, quoted, Opperhuizen 1986)

$\log k_1 = 2.63 \text{ d}^{-1}$; $\log k_2 = 0.440 \text{ d}^{-1}$ (fish, quoted, Connell & Hawker 1988)

$\log k_1 = 2.48 \text{ d}^{-1}$; $\log k_2 = -0.40 \text{ d}^{-1}$ (guppy, 12 to 31-d exposure studies, Gobas et al. 1989)

$\log k_2 = -0.40 \text{ d}^{-1}$ (fish, calculated- K_{OW} , Thomann 1989)

$k_1 = 7 \text{ mL g}^{-1} \text{ d}^{-1}$, $k_2 = 3 \text{ d}^{-1}$ (pond snail *Lymnaea stagnalis*, Legierse et al. 1998)

Half-Lives in the Environment:

Air: residence time of 116 d, loss of 0.9% in 1 d or 12 sunlit hours at 300 K for trichlorobenzenes in urban environments (Singh et al. 1981)

Surface Water: $t_{1/2} = 18 \text{ d}$ under field conditions in the Netherlands in case of first order reduction process may be assumed (estimated, Zoeteman et al. 1980)

direct photolysis $t_{1/2} = 206 \text{ min}$ in aqueous solution (Peijnenburg et al. 1992)

Groundwater:.

Sediment: dechlorination $t_{1/2} = 1.8$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Soil:

Biota: biological half-lives, $t_{1/2} < 1$ d in trout, $t_{1/2} = 2$ d in sunfish and $t_{1/2} = 2$ d in guppy for trichlorobenzenes (Niimi 1987);

$t_{1/2} < 5$ d in worms at 8°C (Oliver 1987a).

TABLE 6.1.1.7.1

Reported aqueous solubilities, octanol-water partition coefficients and octanol-air partition coefficients of 1,3,5-trichlorobenzene at various temperatures

FIGURE 6.1.1.7.2 Logarithm of vapor pressure versus reciprocal temperature for 1,3,5-trichlorobenzene.

6.1.1.8 1,2,3,4-Tetrachlorobenzene

Common Name: 1,2,3,4-Tetrachlorobenzene

Synonym:

Chemical Name: 1,2,3,4-tetrachlorobenzene

CAS Registry No: 634-66-2

Molecular Formula: $C_6H_2Cl_4$

Molecular Weight: 215.892

Melting Point ($^{\circ}C$):

47.5 (Weast 1972–73; Lide 2003)

Boiling Point ($^{\circ}C$):

254 (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

142 (calculated-density, liquid molar volume, Chiou 1985)

179.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.0 (Miller et al. 1984; Ruelle et al. 1993; Chickos et al. 1999)

16.95 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

53.14 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 156\ J/mol\ K$), F: 0.602 (mp at $47.5^{\circ}C$)

0.608 ($25^{\circ}C$, Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

4.31 (shake flask-UV, Yalkowsky et al.)

3.42 (shake flask-GC, Könemann 1981)

4.32 (recommended, Horvath 1982)

3.50 ($22^{\circ}C$, Verschueren 1983)

12.2 (generator column-GC/ECD, Miller et al. 1984, 1985)

7.18 ($23^{\circ}C$, shake flask-GC, Chiou 1985)

5.92 (shake flask-HPLC, Banerjee et al. 1984)

4.33 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

12.2 (generator column-GC, Doucette & Andren 1988)

3.27 (shake flask-GC/ECD, Kim & Saleh 1990)

12.0 (shake flask-GC, Boyd et al. 1998)

1.40, 2.11, 2.80, 5.25 (5, 15, 25, $35^{\circ}C$, estimated- RP-HPLC- k' correlation, Finizio & Di Guardo 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* ($68.5^{\circ}C$, summary of literature data, temp range 68.5 – $254.0^{\circ}C$, Stull 1947)

8.76 (extrapolated-Antoine eq., supercooled liquid P_L , Weast 1972–73)

5.21 (calculated-Antoine eq. from Weast 1972–73, converted to solid P_s ; Mackay & Shiu 1981)

$\log(P/mmHg) = [-0.2185 \times 12872.5/(T/K)] + 8.251056$; temp range 68.5 – $254^{\circ}C$ (Antoine eq., Weast 1972–73)

4.017, 3.49 (P_{GC} by GC-RT correlation with different GC columns, Bidleman 1984)

8.0 (supercooled liquid P_L , converted from literature P_s with ΔS_{fus} , Bidleman 1984)

6.285 (gas saturation-GC, interpolated from reported graph, Rordorf 1985)

2.44 (supercooled liquid P_L , extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.7082 - 1517.2/(-117.384 + T/\text{K})$; temp range 331–527 K (liquid, Antoine eq., Stephenson & Malanowski 1987)

5.60 (selected, supercooled liquid P_L , Suntio et al. 1988b; quoted, Ballschmiter & Wittlinger 1991)

8.0 (supercooled P_L , converted from literature P_S with ΔS_{fus} , Hinckley et al. 1990)

4.02 (P_{GC} by GC-RT correlation, Hinckley et al. 1990)

12.1 (supercooled liquid P_L , GC-Kovács retention indices correlation; Spijksma et al. 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or the reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

70 (gas stripping-GC, Oliver 1985)

62.0* (gas stripping-GC/ECD, measured range 14.8–50.5°C, ten Hulscher et al. 1992)

289 (modified EPICS method-GC, Ryu & Park 1999)

58.5 (20°C, selected from reported experimentally measured values, Staudinger & Roberts 1996, 2001)

$\log K_{\text{AW}} = 5.014 - 1945/(T/\text{K})$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section.:

4.72 (Leo et al. 1971)

4.46 (shake flask-GC, HPLC- k' correlation, Könemann et al. 1979)

4.68 (20°C, shake flask-GC, isomer not specified, Briggs 1981)

4.37 (shake flask-GC, Watarai et al. 1982)

4.94 (TLC-RT correlation, Bruggeman et al. 1982)

4.75 (shake flask-GC, Bruggeman et al. 1982)

4.41 (HPLC- k' correlation, Hammers et al. 1982)

4.55 (generator column-GC, Miller et al. 1984)

4.60 (shake flask-GC, Chiou 1985)

4.65 (HPLC-RV/MS, Burkhard & Kuehl 1986)

4.61* (19°C, shake flask-GC/ECD, measured range 13–33°C, Opperhuizen et al. 1988)

4.60 (shake flask-GC, Pereira et al. 1988)

4.635 (shake flask/slow stirring-GC, De Bruijn et al. 1989)

4.54 (recommended, Sangster 1993)

4.64 (recommended, Hansch et al. 1995)

$4.41 \pm 0.06^*$ (shake flask-GC/ECD, measured range 5–45°C, Bahadur et al. 1997)

$\log K_{\text{OW}} = 0.6978 - 21100/[2.303 \cdot R(T/\text{K})]$, temp range 5–45°C (van't Hoff eq., Bahadur et al. 1997)

4.30* (estimated RP-HPLC- k' correlation, measured range 5–35°C, Finizio & Di Guardo 2001)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

5.64*; 5.74 (generator column-GC; measured range –10 to 20°C, calculated, Harner & Mackay 1995)

$\log K_{\text{OA}} = -5.3 + 3254/(T/\text{K})$; $\Delta H_{\text{OA}} = 62.3 \text{ kJ/mol}$ (Harner & Mackay 1995)

5.64 (calculated- S_{oct} and vapor pressure, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$ at 25°C or as indicated:

4.86 (guppy, lipid basis, Könemann & van Leeuwen 1980)

3.25 (Briggs 1981)

3.36–3.75 mean 3.72; 4.00–4.15 mean 4.08 (rainbow trout, 15°C, steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)

4.80–5.13 (rainbow trout, lipid basis, Oliver & Niimi 1983)

3.72–4.08 (fish, Oliver 1984)

3.70 (15°C, rainbow trout, Banerjee et al. 1984)

3.41–3.93 mean 3.80; 3.49–4.00 mean 3.91 (rainbow trout, wet wt. basis, 15°C, steady-state BCF on 7- to 96-d laboratory study in two tanks of different water concn, Oliver & Niimi 1985)

3.72; .89 (rainbow trout, laboratory data; Lake Ontario field data, Oliver & Niimi 1985)

3.38 (fathead minnow, Carlson & Kosian 1987)

4.9–5.4, 5.1; 4.1 (Niagara River plume, range, mean; calculated- K_{OW} , Oliver 1987b)

- 4.70, 4.74, 4.75, 4.84 (13, 19, 28, 33°C, female guppy, Opperhuizen et al. 1988)
 3.36 (guppy, Van Hoogan & Opperhuizen 1988)
 5.46, 5.70, 4.68, 5.30 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 3.68; 3.79 (*Scenedesmus spp. Coenobia*, dry wt., batch adsorption; purge desorption, Koelmans et al. 1993)
 3.40 (guppy, steady-state conditions, rate const. ratio k_1/k_2 , 96-h exposure, Sijm et al. 1993)
 4.70 (guppy, lipid normalized BCF, Sijm et al. 1993)
 3.72–4.08; 3.82 (*Oncorhynchus mykiss*; *Poecilia reticulata*, flow through conditions, Devillers et al. 1996)
 3.89 (algae *Selenastrum capricornutum*, wet wt basis, isomer not specified, Wang et al. 1996)
 4.28 (pond snail *Lymnaea stagnalis*, lipid wt basis, lipid content 0.5%, Legierse et al. 1998)
 3.96; 3.89 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 3.49 (soil, sorption isotherm, converted from reported log K_{OM} of 3.25, Briggs 1981)
 3.27 (river sediment, 0.56% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
 3.16–4.42 (five soils, 0.04–0.73% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
 5.00; 4.90 (field data of sediment trap material; Niagara River organic matter; Oliver & Charlton 1984)
 4.1–6.0, 5.2 (suspended sediment, average, Oliver 1987c)
 3.52, 3.91, 3.75, 3.48, 3.52 (five soils: clay loam/kaolinite, light clay/montmorillonite, light clay/montmorillite, sandy loam/allophane, clay loam/allophane, batch equilibrium-sorption isotherm, Kishi et al. 1990)
 3.48–3.91 (soil, batch-equilibration, Kishi et al. 1990)
 4.28 (Ispra soil 1.87% OC, shake flask-GC, Paya-Perez et al. 1991)
 4.26 (sediment 3.86% OC, batch sorption equilibrium, Koelmans & Lijkelma 1992)
 4.39 ± 0.33 (suspended particulates in coastal waters, Masunaga et al. 1996)
 3.70, 3.64, 3.84 (soils: organic carbon OC ≥ 0.1%, OC ≥ 0.5%, 0.1 ≤ OC < 0.5%, average, Delle Site 2001)
 4.14 (sediment: organic carbon OC ≥ 0.5%, average, Delle Site 2001)

Sorption Partition Coefficient, log K_{OM} :

- 3.25 (soil, sorption isotherm, shake flask-GC, soil organic matter, Briggs 1981)
 4.90 (Niagara River-organic matter, Oliver & Charlton 1984)
 4.90–5.40; 5.10; 4.10; 4.50 (Niagara-River plume: range; average; calculated- K_{OW} , algae > 50 µm, Oliver 1987b)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation: dechlorination pseudo-first order rate constant $k = 1.455 \text{ d}^{-1}$ with $t_{1/2} = 0.5 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 140 \text{ h}^{-1}$; $k_2 = 0.021 \text{ h}^{-1}$ (rainbow trout, 15°C, Banerjee et al. 1984)

$k_1 = 670 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.29 \text{ d}^{-1}$ (guppy, van Hoogan & Opperhuizen 1988)

$k_1 = 670 \pm 180 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.29 \pm 0.06 \text{ d}^{-1}$ (guppies, 96-h exposure, Sijm et al. 1993)

$k_1 = 1807.8 \text{ h}^{-1}$; $k_2 = 0.304 \text{ h}^{-1}$ (algae *Selenastrum capricornutum*, isomer not specified, Wang et al. 1996)

$k_1 = 141 \text{ mL g}^{-1} \text{ d}^{-1}$, $k_2 = 1.5 \text{ d}^{-1}$ (pond snail *Lymnaea stagnalis*, Legierse et al. 1998)

Half-Lives in the Environment:

Air:

Surface Water:

Groundwater:

Sediment: dechlorination $t_{1/2} = 1.8$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Soil:

Biota: biological half-lives, $t_{1/2} = 3$ d in sunfish and $t_{1/2} = 2$ d in guppy for tetrachlorobenzenes (Niimi 1987); $t_{1/2} < 5$ d in worms at 8°C (Oliver 1987a).

FIGURE 6.1.1.8.2 Logarithm of K_{OW} and K_{OA} versus reciprocal temperature for 1,2,3,4-tetrachlorobenzene.

6.1.1.9 1,2,3,5-Tetrachlorobenzene

Common Name: 1,2,3,5-Tetrachlorobenzene

Synonym:

Chemical Name: 1,2,3,5-tetrachlorobenzene

CAS Registry No: 634-90-2

Molecular Formula: $C_6H_2Cl_4$

Molecular Weight: 215.892

Melting Point ($^{\circ}C$):

54.5 (Weast 1972–73; 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

246 (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

179.6 (calculated-Le Bas method at normal boiling point)

141.0 (Ruelle & Kesselring 1997)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.0 (Miller et al. 1984; Chickos et al. 1999)

19.32 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

58.576 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.514 (mp at $54.5^{\circ}C$)

0.556 (Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

3.50 (shake flask-UV, Yalkowsky et al. 1979)

4.02 (shake flask-LSC, Banerjee et al. 1980)

4.11, 17.1 (LSC- ^{14}C , calculated- K_{ow} , Veith et al. 1980)

2.48 (shake flask-GC, Könnemann 1981)

3.51 (recommended, Horvath 1982)

2.40 ($22^{\circ}C$, Verschueren 1983)

5.10 (shake flask-HPLC, Banerjee 1984)

2.89 (generator column-GC/ECD, Miller et al. 1984, 1985)

3.23 (shake flask-GC, Chiou 1985)

3.46 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

4.32 (generator column-GC, Doucette & Andren 1988)

4.32 (shake flask-GC/ECD, Kim & Saleh 1990)

4.52 (shake flask-GC/ECD, Tam et al. 1996)

$3.44 \pm 0.15^*$, 3.79 ± 0.23 (generator column-GC/ECD, shake flask-GC at $27^{\circ}C$, Shiu et al. 1997)

$\ln x = -4.4222 - 3162.74/(T/K)$; temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* ($58.2^{\circ}C$, summary of literature data, temp range $58.2-246^{\circ}C$, Stull 1947)

18.6 (extrapolated-supercooled liquid P_L , Weast 1972–73)

$\log (P/mmHg) = [-0.2185 \times 11982.1/(T/K)] + 7.925176$; temp range $58.2-246^{\circ}C$ (Antoine eq., Weast 1972–73)

9.80 (solid P_s , calculated from extrapolated vapor pressure P_L with a fugacity ratio correction, Mackay & Shiu 1981)

- 5.085 (gas saturation-GC, interpolated from reported graph, Rordorf 1985)
 17.2; 9.56 (extrapolated-Antoine eq., supercooled liquid P_L , converted to P_S , Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 6.7756 - 2394/(-17.85 + T/K)$; temp range 331–519 K (liquid, Antoine eq., Stephenson & Malanowski 1987)
 15.1 (supercooled liquid P_L , GC-Kováš retention indices correlation; Spieksma et al. 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 159 (batch stripping-GC, Mackay & Shiu 1981)
 99 (20°C, gas stripping-GC, ten Hulscher et al. 1992)
 160 (gas stripping-GC, Shiu & Mackay 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section.:

- 4.50, 4.92 (shake flask-GC, HPLC-k' correlation, Könnemann et al. 1979)
 4.46 (HPLC-RT correlation, Veith et al. 1979b)
 4.46, 5.0 (shake flask-LSC, HPLC-RT correlation, Veith et al. 1980)
 4.52 (shake flask-LSC, Banerjee et al. 1980)
 5.05 (head-space GC, Hutchinson et al. 1980)
 4.68 (20°C, shake flask-GC, isomer not specified, Briggs 1981)
 4.56 (shake flask-GC, Watarai et al. 1982)
 4.53 (HPLC-k' correlation, Hammers et al. 1982)
 4.51 (generator-column-GC/ECD, Miller et al. 1984; 1985)
 4.61–4.73 (HPLC-RV correlation, Garst 1984)
 4.59 (shake flask-GC, Chiou 1985)
 4.59 (shake flask-GC, Pereira et al. 1988)
 4.658 (shake flask/slow stirring-GC, De Bruijn et al. 1989)
 4.63 (recommended, Sangster 1993)
 4.66 (recommended, Hansch et al. 1995)
 4.55* \pm -0.02 (shake flask-GC/ECD, Bahadur et al. 1997)
 $\log K_{OW} = 1.0159 - 20200/[2.303 \cdot R(T/K)]$; temp range 5–45°C (van't Hoff eq., Bahadur et al. 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 5.55 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)
 5.78* (20°C, HPLC-k' correlation, measured range 10–50°C, Su et al. 2002)
 $\log K_{OA} = 66320/(2.303 \cdot RT) - 6.086$; temp range 10–50°C (HPLC-k' correlation, Su et al. 2002)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

- 3.26 (fathead minnow, Veith et al. 1979b)
 4.86 (guppy-lipid basis, Könnemann et al. 1979)
 4.15, 4.86 (guppy-lipid basis, Könnemann & van Leeuwen 1980)
 3.26 (bluegill sunfish, whole body, flow system, Barrows et al. 1980)
 4.80–5.13 (rainbow trout, lipid base, Oliver & Niimi 1983)
 3.46 (22°C, bluegill sunfish, Banerjee et al. 1984)
 3.59 (fish, calculated-concentration ratio C_A/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)
 4.73 (guppy-lipid phase, 12 to 31-d exposure studies, Gobas et al. 1989)
 5.05, 5.20, 4.27, 4.90 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 3.64–4.89 (*Poecilia reticulata*, quoted lit., flow through conditions, Devillers et al. 1996)
 3.89 (algae *Selenastrum capricornutum*, wet wt basis, isomer not specified, Wang et al. 1996)
 4.27 (pond snail *Lymnaea stagnalis*, lipid wt basis, lipid content 0.5%, Legierse et al. 1998)
 4.11; 3.89 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.49 (soil, sorption isotherm, converted from reported $\log K_{OM}$ of 3.25, Briggs 1981)

- 3.20 (Koch 1983)
 4.25 (Ispra soil 1.87% OC, shake flask-GC, Paya-Perez et al. 1991)
 3.94 ± 0.33 (suspended particulates in coastal waters, Masunaga et al. 1996)

Sorption Partition Coefficient, $\log K_{OM}$:

- 3.20, 2.98 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation:

Hydrolysis:

Biodegradation: dechlorination pseudo-first order rate constant $k = 0.639 \text{ d}^{-1}$ with $t_{1/2} = 1.1 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 15000 \text{ d}^{-1}$; $k_2 = 0.26 \text{ d}^{-1}$ (guppy, Könemann & van Leeuwen 1980)

$k_1 = 74 \text{ h}^{-1}$; $k_2 = 0.026 \text{ h}^{-1}$ (bluegill sunfish, Banerjee et al. 1984)

$k_1 = 33.8 \text{ h}^{-1}$; $1/k_2 = 92.0 \text{ h}$ (guppy, Hawker & Connell 1985)

$k_1 = 810 \text{ d}^{-1}$ (fish quoted, Opperhuizen 1986)

$\log k_1 = 2.91 \text{ d}^{-1}$; $\log 1/k_2 = -0.42 \text{ d}$ (guppy, quoted, Connell & Hawker 1988)

$\log k_1 = 3.00 \text{ d}^{-1}$; $\log k_2 = -0.59 \text{ d}^{-1}$ (guppy, 12 to 31-d exposure studies, Gobas et al. 1989)

$\log k_2 = -0.58 \text{ d}^{-1}$ (fish, calculated- K_{OW} , Thomann 1989)

$k_1 = 1807.8 \text{ h}^{-1}$; $k_2 = 0.304 \text{ h}^{-1}$ (algae *Selenastrum capricornutum*, isomer not specified, Wang et al. 1996)

$k_1 = 131 \text{ mL g}^{-1} \text{ d}^{-1}$, $k_2 = 1.4 \text{ d}^{-1}$ (pond snail *Lymnaea stagnalis*, Legierse et al. 1998)

Half-Lives in the Environment:

Air:

Surface Water:

Groundwater:

Sediment: dechlorination $t_{1/2} = 1.8 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Soil:

Biota: $t_{1/2} = 2\text{--}4 \text{ d}$ in fish (Veith et al. 1980);

$2 < t_{1/2} < 4 \text{ d}$ in bluegill sunfish (Barrows et al. 1980).

TABLE 6.1.1.9.1

Reported aqueous solubilities, vapor pressures, octanol-water partition coefficients and octanol-air partition coefficients of 1,2,3,5-tetrachlorobenzene at various temperatures

Aqueous solubility		Vapor pressure		log K _{OW}		log K _{OA}	
Shiu et al. 1997		Stull 1947		Bahadur et al. 1997		Su et al. 2002	
shake flask-GC		summary of literature data		shake flask-GC/ECD		GC-RT correlation	
t/°C	S/g·m ⁻³	t/°C	P/Pa	t/°C	log K _{OW}	t/°C	log K _{OA}
5	1.7	58.2	133.3	5	4.8	10	6.15.

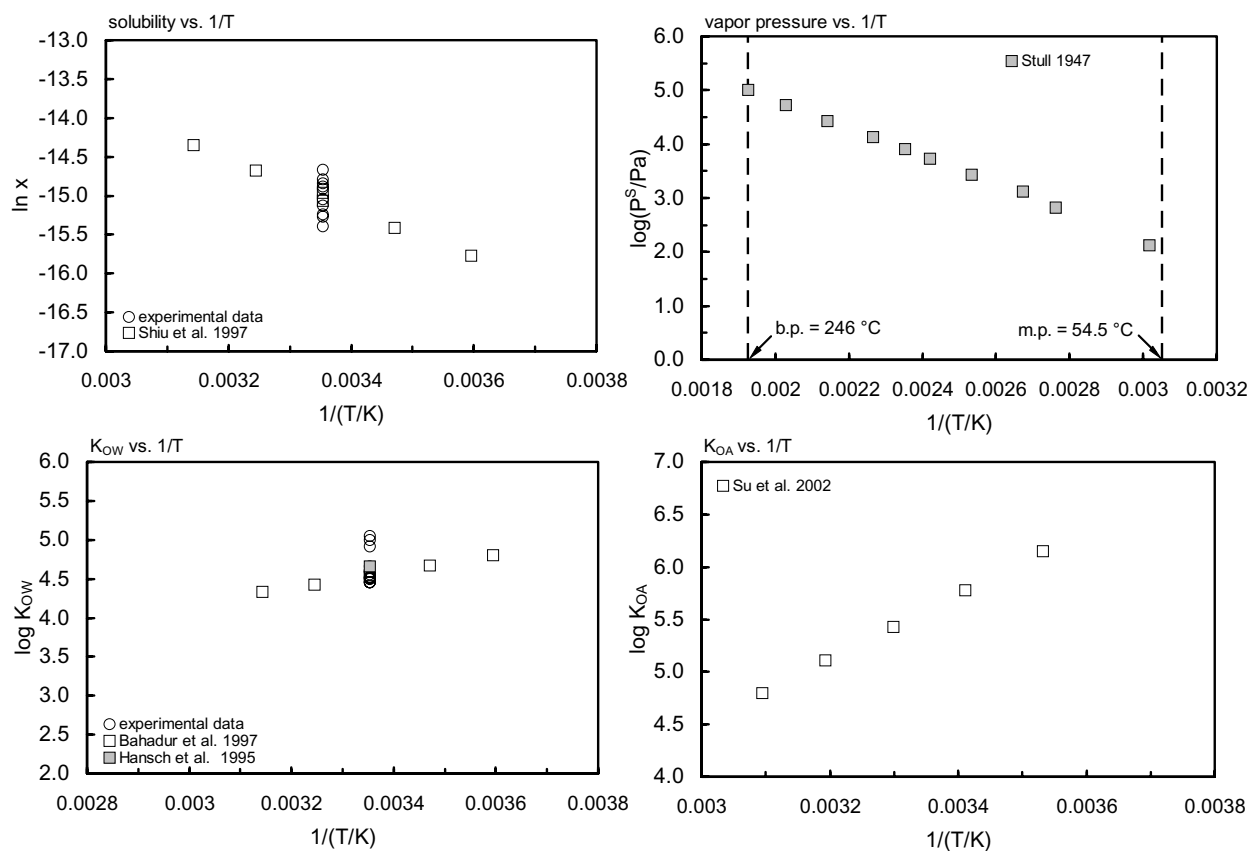

FIGURE 6.1.1.9.1 Logarithm of mole fraction solubility, vapor pressure, K_{OW} and K_{OA} versus reciprocal temperature for 1,2,3,5-tetrachlorobenzene.

6.1.1.10 1,2,4,5-Tetrachlorobenzene

Common Name: 1,2,4,5-Tetrachlorobenzene

Synonym:

Chemical Name: 1,2,4,5-tetrachlorobenzene

CAS Registry No: 95-94-3

Molecular Formula: $C_6H_2Cl_4$

Molecular Weight: 215.892

Melting Point ($^{\circ}C$):

139.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

244.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.858 ($22^{\circ}C$, Weast 1972–1973; Horvath 1982; Lide 2003)

Molar Volume (cm^3/mol):

116.2 ($22^{\circ}C$, calculated-density)

179.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.64 (Miller et al. 1984)

24.10 (Ruelle & Kesselring 1993; Chickos et al. 1999)

29.94 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

58.576 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.0753 (mp at $139.5^{\circ}C$)

0.073 (Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.595 (shake flask-UV, Yalkowsky et al. 1979)

0.29 (shake flask-GC, Könemann 1981)

0.596 (recommended, Horvath 1982)

0.30 ($22^{\circ}C$, quoted, Verschueren 1983)

2.35 (generator column-GC/ECD, Miller et al. 1984, 1985)

0.465 (shake flask-HPLC, Banerjee 1984)

0.606 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

0.56 (shake flask-GC/ECD, Kim & Saleh 1990)

$0.528^* \pm 0.018$, 0.543 ± 0.016 (generator column-GC/ECD, shake flask-GC at $27^{\circ}C$, Shiu et al. 1997)

2.20 (shake flask-GC, Boyd et al. 1998)

$\ln x = -4.529 - 3708.6/(T/K)$; temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5333^* ($146.0^{\circ}C$, summary of literature data, temp range 146.0 – $245^{\circ}C$, Stull 1947)

10.1 (extrapolated-Antoine eq., supercooled liquid P_L , Weast 1972–73)

$\log (P/mmHg) = [-0.2185 \times 12828.8/(T/K)] + 8.282213$; temp range 146 – $245^{\circ}C$ (Antoine eq., Weast 1972–73)

0.72 (P_S converted from P_L of Weast 1972–73, Mackay & Shiu 1981)

0.20 (evaporation rate, Dobbs & Cull 1982)

2.163 (gas saturation-GC, interpolated from reported graph, Rordorf 1985)

- 2.98, 0.22 (supercooled liquid P_L , solid P_S , Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 9.1357 - 4642.36/(132.952 + T/\text{K})$; temp range 419–518 K (liquid, Antoine eq., Stephenson & Malanowski 1987)
 7.497 (GC-RT correlation, Watanabe & Tatsukawa 1989)
 0.615 (calculated-UNIFAC activity coefficients, Banerjee et al. 1990)
 15.1; 12.5 (supercooled liquid P_L , GC-Kovács retention indices correlation; quoted lit., Spieksma et al. 1994)
 0.392* (24.65°C, torsion, mass-loss effusion, measured range 17–32.5°C, Blok et al. 2001)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 101 (gas stripping-GC, Oliver 1985)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 4.72 (Leo et al. 1971)
 4.82, 4.56 (shake flask-GC, HPLC- k' correlation, Könemann et al. 1979)
 4.68 (20°C, shake flask-GC, isomer not specified, Briggs 1981)
 4.46 (shake flask-GC, Watarai et al. 1982)
 4.52 (HPLC- k' correlation, Hammers et al. 1982)
 4.51 (generator column-GC/ECD, Miller et al. 1984, 1985)
 4.70 (shake flask-GC, Chiou 1985)
 4.60 (HPLC- k' correlation, Mailhot 1987)
 5.16 (RP-HPLC-capacity factor correlation, Opperhuizen & Voors 1987)
 4.604 (slow stirring-GC, De Bruijn et al. 1989)
 5.16 (calculated-fragment const., De Bruijn et al. 1989)
 4.70 (shake flask-GC, Pereira et al. 1988)
 4.63 (recommended, Sangster 1993)
 4.70 (recommended, Hansch et al. 1995)
 4.97–5.10 (shake flask/slow stirring-GC/ECD, both phases, Fisk et al. 1998)
 4.44* (estimated- RP-HPLC- k' correlation, measured range 5–35°C, Finizio & Di Guardo 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C and the reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.:

- 5.63*; 5.81 (generator column-GC, measured range –10 to 20°C; calculated, Harner & Mackay 1995)
 $\log K_{OA} = -5.0 + 3176/(T/\text{K})$; $\Delta H_{OA} = 60.8 \text{ kJ/mol}$ (Harner & Mackay 1995)
 5.62, 5.63 (calculated- S_{oct} and vapor pressure P , quoted lit., Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

- 0.20 (rats, adipose tissue, Geyer et al. 1980)
 3.65 (fish, flowing water, Kenaga & Goring 1980; Kenaga)
 3.36–3.79 mean 3.72; 4.04–4.18 mean 4.11 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
 4.80–5.13 (rainbow trout, lipid base, Oliver & Niimi 1983)
 3.72–4.11 (fish, Oliver 1984)
 2.80 (Tadokoro & Tomita 1987)
 3.89 (green algae, Mailhot 1987)
 4.08 (guppy, concn ratio of C_{fish}/C_{water} , Opperhuizen & Voors 1987)
 5.05, 5.20, 4.27, 4.90 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 2.76 (*picea omorika*, Reischl et al. 1989)
 3.61, 4.70 (American flagfish: whole fish, fish lipid, Smith et al. 1990)
 3.20 (fish, calculated, Figueroa & Simmons 1991)
 3.72–4.11; 3.61 (*Oncorhynchus mykiss*; *Jordanella floridae*, quoted lit., flow through conditions, Devillers et al. 1996)
 3.89 (algae *Selenastrum capricornutum*, wet wt basis, isomer not specified, Wang et al. 1996)
 3.72, 4.80; 3.517, 3.417 (quoted: whole fish, lipid content; calculated-MCI χ , calculated- K_{OW} , Lu et al. 1999)

3.89; 3.89 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

3.20 (Kenaga 1980a)
 3.49 (soil, sorption isotherm, converted from reported log K_{OM} of 3.25, Briggs 1981)
 3.36 (river sediment, 0.56% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
 3.24–4.50 (five soils, 0.04–0.73% OC, batch equilibrium-sorption isotherm, Schwarzenbach & Westall 1981)
 5.10; 4.70 (field data of sediment trap material; Niagara River-organic matter; Oliver & Charlton 1984)
 2.79 (McLaurin sandy loam, OC 0.66%, pH 4.43, batch equilibrium-sorption isotherm, Walton et al. 1992)
 3.94 ± 0.33 (suspended particulates in coastal waters, Masunaga et al. 1996)
 3.48 (soil: organic carbon OC ≥ 0.1%, average, Delle Site 2001)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $t_{1/2} = 763.1$ –7631 h, based on photooxidation half-life in air (Howard et al. 1991)

Hydrolysis: base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C with a calculated $t_{1/2} > 900$ yr at pH 7, based on assumed bases mediated 1% disappearance after 16 d at 85°C and pH 9.70 (Ellington et al. 1988)
 first order hydrolysis $t_{1/2} > 879$ yr (Howard et al. 1991)

Biodegradation: $t_{1/2}(\text{aerobic}) = 672$ –4320 h, based on unacclimated aerobic screening test data; $t_{1/2}(\text{anaerobic}) = 2880$ –17280 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

dechlorination pseudo-first order $k = 0.037 \text{ d}^{-1}$ with $t_{1/2} = 18.7$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 1490 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.14 \text{ d}^{-1}$ (guppy, continuous flow aqueous saturation system, Opperhuizen & Voors 1987)

$k_1 = 1630 \text{ d}^{-1}$, 171000 d^{-1} ; $k_2 = 0.4 \text{ d}^{-1}$, 0.34 d^{-1} (American flagfish: whole fish, fish lipid, Smith et al. 1990)

$k_2 = 0.4 \text{ d}^{-1}$, 2.35 d^{-1} (American flagfish: bioconcentration data, toxicity data, Smith et al. 1990)

$k_1 = 1807.8 \text{ h}^{-1}$; $k_2 = 0.304 \text{ h}^{-1}$ (algae *Selenastrum capricornutum*, isomer not specified, Wang et al. 1996)

Half-Lives in the Environment:

Air: $t_{1/2} = 763.1$ –7631 h, based on photooxidation half-life in air (Howard et al. 1991)

Surface Water: hydrolysis $t_{1/2} > 900$ yr at pH 7 and 25°C (Ellington et al. 1988)

$t_{1/2} = 672$ –4320 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Groundwater: $t_{1/2} = 1344$ –8640 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment: dechlorination $t_{1/2} = 18.7$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Soil: $t_{1/2} = 672$ –4320 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biota: $t_{1/2} < 5$ d in worms at 8°C (Oliver 1987a);

biological $t_{1/2} = 3$ d in sunfish, $t_{1/2} = 2$ d in guppy for tetrachlorobenzenes (Niimi 1987);

$t_{1/2} = 33$ d in *Picea omorika* (Reischl et al. 1989);

$t_{1/2} = 1.72$ d clearance from American flagfish (Smith et al. 1990);

elimination $t_{1/2} = 2.01$ d from earthworm in water (Belfroid et al. 1993);

elimination $t_{1/2} = 0.204$ d and 2.63 d in a two-phase kinetics for earthworm in OECD soil (Belfroid et al. 1994).

TABLE 6.1.1.10.1

Reported aqueous solubilities and vapor pressures of 1,2,4,5-tetrachlorobenzene at various temperatures and the coefficients for the vapor pressure equations

$\log P = A - B/(T/K)$	(1)	$\ln P = A - B/(T/K)$	(1a)				
$\log P = A - B/(C + t/^{\circ}\text{C})$	(2)	$\ln P = A - B/(C + t/^{\circ}\text{C})$	(2a)				
$\log P = A - B/(C + T/K)$	(3)						
$\log P = A - B/(T/K) - C \cdot \log (T/K)$	(4)

6.1.1.11 Pentachlorobenzene

Common Name: Pentachlorobenzene

Synonym:

Chemical Name: Pentachlorobenzene

CAS Registry No: 608-93-5

Molecular Formula: C_6HCl_5

Molecular Weight: 250.337

Melting Point ($^{\circ}C$):

86 (Weast 1972–73; Lide 2003)

Boiling Point ($^{\circ}C$):

277 (Weast 1972–72; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.8342 (16.5 $^{\circ}C$, Weast 1972–73; Horvath 1982)

Molar Volume (cm^3/mol):

136.5 (16.5 $^{\circ}C$, calculated-density, Weast 1972–73; Horvath 1982)

166 (liquid molar volume, Chiou 1985)

200.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

20.585 (Miller et al. 1984)

20.60 (Ruelle et al. 1993; Chickos et al. 1999)

20.1 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

57.74 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K.), F: 0.252 (mp at $86^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.56 (shake flask-UV, Yalkowsky et al. 1979)

1.33 (shake flask-LSC, Banerjee et al. 1980)

0.135 (Kenaga & Goring 1980; Kenaga 1980a)

1.34 (shake flask-LSC- ^{14}C , Veith et al. 1980)

0.24 (shake flask-GC, Könnemann 1981)

0.562 (recommended, Horvath 1982)

0.831 (generator column-GC/ECD, Miller et al. 1984, 1985)

0.385 (23 $^{\circ}C$, shake flask-GC, Chiou 1985)

0.180 (generator column-GC/ECD, Opperhuizen et al. 1985)

0.552 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

3.46 (calculated- K_{ow} and HPLC-RT correlation, Chin et al. 1986)

$0.419^* \pm 0.018$, 0.447 ± 0.014 (generator column-GC/ECD, shake flask-GC/ECD at $27^{\circ}C$, Shiu et al. 1997)

0.87 (shake flask-GC, Boyd et al. 1998)

$\ln x = -3.61482 - 4093.10/(T/K)$; temp range 5–50 $^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

2.75, 3.50 (supercooled liquid: derivation of literature-derived value LDV, final-adjusted value FAV, Shen & Wania 2005)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133* (98.6 $^{\circ}C$, summary of literature data, temp range 98.6–276 $^{\circ}C$, Stull 1947)

- 0.889 (extrapolated-Antoine eq., supercooled liquid P_L , Weast 1972–73)
 0.219 (P_S calculated from P_L of Weast 1972–73; Mackay & Shiu 1981)
 $\log (P/\text{mmHg}) = [-0.2185 \times 15124.2/(T/K)] + 8.907497$; temp range 98.6–276°C (Antoine eq., Weast 1972–73)
 1.44 (gas saturation-GC, interpolated from reported graph, Rordorf 1985)
 1.08, 0.28 (supercooled liquid P_L , solid P_S , Antoine eq., Stephenson & Malanowski 1987)
 $\log (P_L/\text{kPa}) = 8.00795 - 3325.33/(4.814 + T/K)$; temp range 371–549 K (liquid, Antoine eq., Stephenson & Malanowski 1987)
 1.718 (GC-RT correlation, Watanabe & Tatsukawa 1989)
 2.49; 2.19 (supercooled liquid P_L , GC-Kovács retention indices correlation; quoted lit., Spijksma et al. 1994)
 0.212; 0.39* (25°C extrapolated; 30.3°C, static method-pressure gauge, measured range 30.3–179°C, Polednicek et al. 1996)
 $\ln (P_S/\text{Pa}) = 30.4445 - 8654.67/[(T/K) - 27.6534]$; temp range 303.45–353.17 K (solid, Antoine eq. from exptl data, pressure gauge measurement, Polednicek et al. 1996)
 $\ln (P_L/\text{Pa}) = 23.4783 - 6188.33/[(T/K) - 34.6922]$; temp range 371.8–452.29 K (liquid, Antoine eq. from exptl data, pressure gauge measurement, Polednicek et al. 1996)
 0.11* (20°C, recommended, summary of literature data, temp range 233.15–503.15 K, Roháč et al. 1999)
 $\ln [(P_S/\text{Pa})/67.0] = [1 - (T/K)/357.0] \cdot \exp\{3.431590 - 1.8864070 \times 10^{-4} \cdot (T/K)\}$; temp range 300–353 K (Cox eq., solid, recommended, Roháč et al. 1999)
 $\ln [(P_L/\text{Pa})/67.0] = [1 - (T/K)/357.0] \cdot \exp\{3.419638 - 1.1673259 \times 10^{-3} \cdot (T/K) + 7.7842905 \times 10^{-7} \cdot (T/K)^2\}$; temp range 365–452 K (Cox eq., liquid recommended, Roháč et al. 1999)
 $\log (P/\text{kPa}) = 15.6174 - 4831.4/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
 1.2, 1.0 (supercooled liquid P_L : LDV literature derived value, FAV final adjusted value, Shen & Wania 2005)
 $\log (P_L/\text{Pa}) = -3220/(T/K) + 10.87$ (supercooled liquid, linear regression of literature data, Shen & Wania 2005)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

- 71.9 (gas stripping-GC, Oliver 1985)
 59.0* (gas stripping-GC/ECD, measured range 14.8–50.5°C, ten Hulscher et al. 1992)
 52.6 (20°C, selected from reported experimentally measured values, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 5.607 - 2132/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)
 74, 70 (LDV literature-derived value, FAV final adjusted value, Shen & Wania 2005)
 $\log K_{AW} = -2026/(T/K) + 5.27$ (LDV linear regression of literature data, Shen & Wania 2005)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 5.79 (calculated-fragment const., Yalkowsky et al. 1979)
 4.88, 5.52 (shake flask-GC, HPLC- k' correlation, Könnemann et al. 1979)
 4.94 (shake flask-LSC, Banerjee et al. 1980)
 4.94, 5.29 (shake flask-LSC, HPLC-RT correlation, Veith et al. 1980)
 5.17 (shake flask-GC, Watarai et al. 1982)
 5.06 (HPLC- k' correlation, Hammers et al. 1982)
 5.69 (HPLC-RT correlation, Bruggeman et al. 1982)
 5.03 (generator column-GC/ECD, Miller et al. 1984; 1985)
 5.17 (shake flask-HPLC, Banerjee 1984)
 5.11–5.21 (HPLC-RV correlation, Garst 1984)
 5.20 (shake flask-GC, Chiou 1985)
 4.97 (calculated- K_{OW} and HPLC-RT correlation, Chin et al. 1986)
 6.12 (HPLC- k' correlation, De Kock & Lord 1987)
 5.47 (HPLC-RT correlation, Doucette & Andren 1988)
 5.20 (shake flask-GC, Pereira et al. 1988)
 5.05* (19°C, shake flask-GC, measured range 13–33°C, Opperhuizen et al. 1988)
 5.183 (shake flask/slow stirring-GC, De Bruijn et al. 1989)
 5.17 (recommended, Sangster 1993)
 5.18 (recommended, Hansch et al. 1995)
 4.94* ± 0.03 (shake flask-GC/ECD, Bahadur et al. 1997)

$\log K_{OW} = 0.9255 - 22800/[2.303 \cdot R(T/K)]$; temp range 5–45°C (van't Hoff eq., Bahadur et al. 1997)
 5.67–5.78 (shake flask/slow stirring-GC/ECD, both phases, Fisk et al. 1998)
 5.08, 5.19 (LDV literature-derived value, FAV final-adjusted value, Shen & Wania 2005)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

6.27*; 6.46 (generator column-GC, measured range –10 to 20°C, calculated, Harner & Mackay 1995)
 7.93, 7.418, 6.931, 6.539 (–10, 0, 10, 18.7°C, generator column-GC, Harner & Mackay 1995)
 $\log K_{OA} = -6.2 + 3722.3/(T/K)$; temp range –10 to 20°C, $\Delta H_{OA} = 72.3$ kJ/mol (generator column-GC, Harner & Mackay 1995)
 6.50 (calculated- K_{OW}/K_{AW} , Wania & Mackay 1996)
 6.49, 6.27 (calculated- S_{oct} and vapor pressure P, quoted lit., Abraham et al. 2001)
 6.90, 6.73 (LDV literature derived value, FAV final adjusted value, Shen & Wania 2005)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

3.89 (trout muscle, Neely et al. 1974)
 3.70 (fish, flowing water, Kenaga & Goring 1980; Kenaga 1980a)
 5.40 (guppy, lipid content, Könemann et al. 1979)
 3.53 (bluegill sunfish, Veith et al. 1980)
 3.53 (bluegill sunfish, whole body, flow system, Barrows 1980)
 5.41 (guppy, lipid basis, Könemann & van Leeuwen 1980)
 3.84 (fish, flowing water, Garten & Trabalka 1983)
 3.46–4.15 mean 4.11; 4.26–4.36 mean 4.30 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
 5.19–5.36 (rainbow trout, lipid basis, Oliver & Niimi 1983)
 4.11–4.30 (rainbow trout, Oliver 1984)
 3.71 (22°C, bluegill sunfish, 1.5% lipid, Banerjee et al. 1984)
 3.65; 3.86 (15°C, rainbow trout, 1.8% lipid; guppy, 2.8% lipid, Banerjee et al. 1984)
 3.60; 3.49 (algae: exptl.; calculated, Geyer et al. 1984)
 3.65 (algae, Freitag et al. 1984; Halfon & Reggiani 1986)
 3.48 (fish, Freitag et al. 1984; Halfon & Reggiani 1986)
 3.48, 3.65, 4.16 (fish, algae, activated sludge, Freitag et al. 1985)
 4.23 (guppy, calculated-rate constants ratio k_1/k_2 , Opperhuizen et al. 1985)
 3.92 (fathead minnow, Carlson & Kosian 1987)
 2.83, 2.65 (human fat, Geyer et al. 1987)
 4.28, 4.30 (worm, fish, Oliver 1987a)
 3.36–3.42 (fish, Tadokoro & Tomita 1987)
 5.46 (guppy, lipid weight base, 12 to 31-d exposure studies, Gobas et al. 1989)
 3.87 (*picea omorika*, Reischl et al. 1989)
 5.33 (fish, calculated- K_{OW} , Thomann 1989)
 4.14, 2.96, 4.23 (fish, Connell & Hawker 1988; Hawker 1990)
 5.11, 5.18, 5.20, 5.28 (13, 19, 28, 33°C, female guppy, Opperhuizen et al. 1988)
 3.67 (guppy, Van Hoogan & Opperhuizen 1988)
 5.93, 6.12, 4.96, 5.57 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 4.22 (*Scenedesmus spp. Coenobia*, dry wt., batch adsorption, Koelmans et al. 1993)
 3.70 (guppy, steady-state conditions, rate const. ratio k_1/k_2 , 96-h exposure, Sijm et al. 1993)
 5.00 (guppy, lipid normalized BCF, Sijm et al. 1993)
 4.11–4.30; 2.94–4.36; 3.53 (*Oncorhynchus mykiss*; *Poecilia reticulata*; *Lepomis macrochirus*, quoted lit., flow through conditions, Devillers et al. 1996)
 5.22–5.50 (pond snail *Lymnaea stagnalis*, lipid wt basis, lipid content 0.5%, Legierse et al. 1998)
 4.11, 5.19; 3.797, 3.877 (quoted: whole fish, lipid content; calculated-MCI χ , calculated- K_{OW} , Lu et al. 1999)
 4.09; 3.96 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.11 (Kenaga 1980a)
- 5.30; 5.40 (field data of Lake Ontario sediment trap material; Niagara River-organic matter; Oliver & Charlton 1984)
- 4.60 (bottom sediment, Karickhoff & Morris 1985)
- 4.9–6.2, 5.8 (suspended sediment, average, Oliver 1987c)
- 5.7 (algae > 50 μm , Oliver 1987c)
- 5.50–5.90, 5.70 (Niagara River plume: range, average, Oliver 1987b)
- 4.49 (Ispra soil 1.87% OC, shake flask-GC, Paya-Perez et al. 1991)
- 4.68 (lake sediment 2.5% OC, batch sorption equilibrium, Schrap et al. 1994)
- 4.59 \pm 0.41 (suspended particulates in coastal waters, Masunaga et al. 1996)
- 4.91 (sediment: organic carbon OC \geq 0.1%, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $t_{1/2} = 1088\text{--}10877$ h, based on estimated rate constant for the vapor phase reaction with OH radicals in air (Howard et al. 1991)Hydrolysis: base rate constant $k < 0.9 \text{ M}^{-1} \text{ h}^{-1}$ at 25°C with a calculated $t_{1/2} > 900$ yr at pH 7, based on assumed bases mediated 1% disappearance after 16 d at 85°C and pH 9.70 (Ellington et al. 1988)first order $t_{1/2} > 879$ yr (Howard et al. 1991)Biodegradation: $t_{1/2}(\text{aerobic}) = 4656\text{--}8280$ h, based on estimated unacclimated aerobic soil grab sample data; $t_{1/2}(\text{anaerobic}) = 18642\text{--}33120$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)dechlorination pseudo-first order rate constant $k = 0.557 \text{ d}^{-1}$ with $t_{1/2} = 1.2$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants: $k_1 = 18.76 \text{ h}^{-1}$; $k_2 = 0.00238 \text{ h}^{-1}$ (trout, Neely et al. 1974) $k_1 = 22000 \text{ d}^{-1}$; $k_2 = 0.14 \text{ d}^{-1}$ (guppy, Könemann & van Leeuwen 1980) $k_1 = 130 \text{ d}^{-1}$; $k_2 = 0.15 \text{ d}^{-1}$ (guppy, Bruggeman et al. 1984) $k_1 = 110 \text{ h}^{-1}$; $k_2 = 0.021 \text{ h}^{-1}$ (22°C, bluegill sunfish, Banerjee et al. 1984) $k_1 = 170 \text{ h}^{-1}$; $k_2 = 0.036 \text{ h}^{-1}$ (15°C, rainbow trout, Banerjee et al. 1984) $k_1 = 98 \text{ h}^{-1}$; $k_2 = 0.014 \text{ h}^{-1}$ (15°C, guppy, Banerjee et al. 1984) $k_1 = 5.4 \text{ h}^{-1}$; $1/k_2 = 160$ h (guppy, quoted, Hawker & Connell 1985) $k_1 = 1400 \text{ d}^{-1}$; $k_2 = 0.078 \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1985) $k_1 = 1200 \text{ d}^{-1}$ (fish, quoted, Opperhuizen 1986) $k_2 = 0.00309, 0.00402 \text{ d}^{-1}$ (rainbow trout, calc-fish mean body weight, Barber et al. 1988) $\log k_1 = 3.08 \text{ d}^{-1}$; $\log 1/k_2 = 0.96 \text{ d}$ (fish, quoted, Connell & Hawker 1988) $k_1 = 710 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.15 \text{ d}^{-1}$ (guppy, Van Hoogan & Opperhuizen 1988) $\log k_1 = 3.24 \text{ d}^{-1}$; $\log k_2 = -0.96 \text{ d}^{-1}$ (guppy, 12 to 31-d exposure studies, Gobas et al. 1989a) $k_1 = 0.049 \text{ h}^{-1}$; $k_2 = 0.027 \text{ h}^{-1}$ (mayfly-sediment model II, Gobas et al. 1989b) $\log k_2 = -0.82 \text{ d}^{-1}$; -0.96 d^{-1} (fish, calculated- K_{OW} , Thomann 1989) $1/k_2 = 9.12, 12.9 \text{ d}$ (guppy, Clark et al. 1990) $k_1 = 710 \pm 290 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.15 \pm 0.04 \text{ d}^{-1}$ (guppies, 96-h exposure., Sijm et al. 1993) $k_2 = 0.00116 \text{ d}^{-1}$ (18°C earthworm in field-contaminated soil, Belfroid et al. 1995) $k_1 = (240\text{--}290) \text{ mL g}^{-1} \text{ d}^{-1}$, $k_2 = (0.3\text{--}0.19) \text{ d}^{-1}$ (pond snail *Lymnaea stagnalis*, Legierse et al. 1998)

Half-Lives in the Environment:

Air: $t_{1/2} = 1088\text{--}10877$ h, based on estimated rate constant for the vapor phase reaction with OH radicals (Howard et al. 1991)Surface Water: $t_{1/2} = 4656\text{--}8280$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)Groundwater: $t_{1/2} = 9312\text{--}16560$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment: dechlorination $t_{1/2} = 1.20$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Soil: $t_{1/2} = 4656\text{--}8280$ h, based on estimated unacclimated aerobic soil grab sample data (Howard et al. 1991)

Biota: $t_{1/2} > 7$ d in fish (Veith et al. 1980);

$t_{1/2} > 7$ d in bluegill sunfish (Barrows et al. 1980);

$t_{1/2} = 4.6$ d in guppy (Bruggeman et al. 1984);

$t_{1/2} = 8.9$ d in guppy (Opperhuizen et al. 1985);

$t_{1/2} < 5$ d in worms at 8°C (Oliver 1987a);

biological half-lives, $t_{1/2} > 7$ d in sunfish, $t_{1/2} = 4, 5$ and < 5 d in guppy (Niimi 1987);

$t_{1/2} = 27$ d in *picea omorika* (Reischl et al. 1989);

elimination $t_{1/2} = 5.46$ d from earthworm in water (Belfroid et al. 1993);

elimination $t_{1/2} = 0.53$ d and 5.9 d in a two-phase kinetics from earthworm in OECD soil (Belfroid et al. 1994);

elimination $t_{1/2} = 0.60$ d from earthworm in Volgermeerpolder soil (Belfroid et al. 1995).

6.1.1.12 Hexachlorobenzene

Common Name: Hexachlorobenzene

Synonym: HCB, perchlorobenzene, anticarie, Bunt-cure, Bunt-no-more, Julin's carbon chloride

Chemical Name: hexachlorobenzene

CAS Registry No: 118-74-1

Molecular Formula: C_6Cl_6

Molecular Weight: 284.782

Melting Point ($^{\circ}C$):

228.83 (Lide 2003)

Boiling Point ($^{\circ}C$):

325 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.5691 ($23.6^{\circ}C$, Weast 1972–73; Horvath 1982)

2.004 ($23^{\circ}C$, Lide 2003)

Molar Volume (cm^3/mol):

181.5 ($23.6^{\circ}C$, calculated-density, Weast 1972–73; Horvath 1982)

221.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.85 (Plato & Glasgow 1969; Ruelle et al. 1993; Chickos et al. 1999)

28.74 (Tsonopoulos & Prausnitz 1971)

22.40 (Miller et al. 1984)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

57.32 (Tsonopoulos & Prausnitz 1971)

44.77 (Miller et al. 1984)

47.1 (Hinckley et al. 1990; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.01 (mp at $228.83^{\circ}C$)

0.009 (Miller et al. 1985; Suntio et al. 1988b)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.005 (generator column-GC/ECD, Weil et al. 1974)

0.006 (shake flask-LSC/ ^{14}C , Lu & Metcalf 1975)

0.11 (shake flask-nephelometric spectrophotofluorometry, Hollifield 1979)

0.005 (shake flask-UV, Yalkowsky et al. 1979)

0.0039 (shake flask-GC, Könemann 1981)

0.00921, 0.00996 (15, $25^{\circ}C$, generator column/elution method, average values of 6–7 labs., OECD 1981)

0.0054 (generator column-GC/ECD, Hashimoto et al. 1982)

0.0012–0.014 (shake flask-GC/ECD, Hashimoto et al. 1982)

0.005 (recommended, Horvath 1982)

0.047 (generator column-GC/ECD, Miller et al. 1984; 1985)

0.005 (recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

0.00544 ± 0.00018 (generator column-GC/ECD, measured range 5 – $45^{\circ}C$, Shiu et al. 1997)

0.38 (shake flask-GC, Boyd et al. 1998)

0.0050 ± 0.00002 (solid-phase micro-extraction SPME-GC, Paschke et al. 1998)

$\log [S_L/(mol/L)] = 0.450 - 1212/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\ln x = -8.22956 - 4037.26/(T/K)$; temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

0.010* (generator column-GC/ECD, measured range 15 – $55^{\circ}C$, Oleszek-Kudlak et al. 2004)

0.0273, 0.398 (supercooled liquid: derivation of literature-derived value FAV, final-adjusted value FAV, Shen & Wania 2005)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

 7.384* (generator column-GC, measured range 5–25°C, Shoeib & Harner 2002)
 7.38, 7.21 (LDV literature derived value, FAV final adjusted value, Shen & Wania 2005)

Bioconcentration Factor, $\log \text{BCF}$ at 25°C or as indicated:

3.89 (rainbow trout, calculated-rate constant ratio k_1/k_2 , Neely et al. 1974)
 3.09 (fish, Körte et al. 1978)

- 4.27, 3.73, 4.34 (fathead minnow, rainbow trout, green sunfish, Veith et al. 1979b)
 5.46 (guppy, lipid basis, Könnemann & van Leeuwen 1980;)
 4.27 (fish, Ciam et al. 1980)
 1.20 (rats, adipose tissue, Geyer et al. 1980)
 3.93, 2.46 (fish, flowing water, static water, Kenaga & Goring 1980; Kenaga 1980a)
 4.39 (algae, Geyer et al. 1981)
 3.38–4.08 mean 4.08; 3.88–4.30 mean 4.30 (rainbow trout, 15°C, wet wt., steady-state BCF on 8- to 119-d laboratory study in low exposure tank; 7- to 105-d high exposure water tank, Oliver & Niimi 1983)
 5.16–5.37 (15°C, rainbow trout, lipid basis, Oliver & Niimi 1983; quoted, Chiou 1985)
 4.39, 3.36, 4.54 (algae, fish, activated sludge, Klein et al. 1984)
 4.34 (sunfish; rainbow trout, 15°C, Davis & Dobbs 1984)
 4.54 (activated sludge, Freitag et al. 1984; Halfon & Reggiani 1986)
 5.09 (green algae, dry wt basis, Geyer et al. 1985)
 4.39, 3.41, 4.54 (algae, fish, activated sludge, Freitag et al. 1985)
 2.62–2.97; 2.44–2.79 (human fat: lipid basis, wet weight, Geyer et al. 1987)
 4.41 (algae, Mailhot 1987)
 4.34 (fathead minnow, Carlson & Kosian 1987)
 4.38, 4.30 (worms, fish, Oliver 1987a)
 3.48 (fish-normalized, Tadokoro & Tomita 1987)
 5.57, 5.62, 5.66, 5.76 (13, 19, 28, 33°C, female guppy, Opperhuizen et al. 1988)
 6.42, 6.71, 5.96, 5.98 (field data-lipid base: Atlantic croakers, blue crabs, spotted sea trout, blue catfish, Pereira et al. 1988)
 –1.35, –2.07, –0.32 (beef, milk, vegetable, reported as biotransfer factor log B_b , Travis & Arms 1988)
 5.46 (guppy-lipid base, 12 to 31-d exposure studies, Gobas et al. 1989)
 3.53 (*picea omorika*, Reischl et al. 1989)
 3.57 (fish, calculated, Figueroa & Simmons 1991)
 4.73; 4.76 (*Scenedesmus spp. Coenobia*, dry wt., batch adsorption; purge desorption, Koelmans et al. 1993)
 3.74–4.30; 4.21; 4.34; 4.16; (*Oncorhynchus mykiss*; *Poecilia reticulata*; *Lepomis cyanellus*; *Oryzias latipes*, quoted lit., flow through conditions, Devillers et al. 1996)
 5.62 (*Poecilia reticulata*, quoted lit., static and semi-static conditions, Devillers et al. 1996)
 3.18, 4.39 (macrophytes *Myriophyllum spicatum*, algae *Chlorella fusca*, wet wt basis, Wang et al. 1996)
 5.55 (pond snail *Lymnaea stagnalis*, lipid wt basis, lipid content 0.5%, Legierse et al. 1998)
 4.38, 5.08 (algae *Chlorella*: wet wt basis, dry wt basis, Geyer et al.2000)
 3.98, 5.98 (*Daphnia*: wet wt basis, lipid wt basis, Geyer et al.2000)
 > 3.54, > 5.54 (mussel *Mytilus edulis* 21-d non-steady state: wet wt basis, lipid wt basis, Geyer et al.2000)
 3.69, 5.71 (golden orfe *Leuciscus idus melanotus*, 0.95% lipid: wet wt basis, lipid wt basis, Geyer et al.2000)
 2.65, 2.83 (human, fat: wet wt basis, lipid wt basis, Geyer et al.2000)
 3.74; 3.95 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 3.59 (Kenaga & Goring 1980; Kenaga 1980a)
 4.45 (Kenaga 1980a)
 4.49 (soil, sorption isotherm, converted from reported log K_{OM} of 4.25, Briggs 1981)
 2.56 (Speyer soil < 2.00 mm, Freundlich isotherm, Rippen et al. 1982)
 2.70 (Alfisol, Freundlich isotherm, Rippen et al. 1982)
 5.90; 5.50 (field data of Lake Ontario sediment trap material; Niagara River organic matter, Oliver & Charlton 1984)
 4.90, 5.2–6.0 (bottom sediment, range, Karickhoff & Morris 1985)
 5.2–6.7, 6.1; 5.80 (suspended sediment, average; algae > 50 μ m, Oliver 1987c)
 6.0–6.50, 6.30; 5.10 (Niagara River plume: range, mean; calculated- K_{OW} , Oliver 1987b)
 4.77 (HPLC- k' correlation, Hodson & Williams 1988)
 4.66, 3.08, 4.91 (soil/water, soil-dextran/water, humic acid/water, batch equilibrium-sorption isotherm, Enfield et al. 1989)

- 3.23, 4.73; 4.59 (Captina silt loam OC 1.49%, McLaurie sandy loam OC 0.66%; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)
- 5.51 (organic matter, Koelmans et al. 1993)
- 4.89 ± 0.36 (suspended particulates in coastal waters, Masunaga et al. 1996)
- 4.70; 3.53 (HPLC-screening method; calculated-PCKOC fragment method, Müller & Kördel 1996)
- 4.23, 3.79 (soils: organic carbon OC ≥ 0.1%, OC ≥ 0.5%, average, Delle Site 2001)
- 5.53, 5.48 (sediments: organic carbon OC ≥ 0.1%, OC ≥ 0.5%, average, Delle Site 2001)

Sorption Partition Coefficient, log K_{OM} :

- 4.25 (soil-organic matter, sorption isotherm, shake flask-GC, Briggs 1981)
- 5.50 (Niagara River-organic matter, Oliver & Charlton 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: $k = 3.45 \times 10^{-10} \text{ mol m}^{-2} \text{ h}^{-1}$ (Gückel et al. 1982).

Photolysis:

Oxidation: rate constant in air, $k = 1.44 \times 10^{-2} \text{ h}^{-1}$ (Brown et al. 1975; quoted, Mackay et al. 1985); photooxidation $t_{1/2} = 3753\text{--}37530 \text{ h}$, based on estimated rate constant for the vapor phase reaction with hydroxyl radical in air (Atkinson 1987).

Hydrolysis: not expected to be important, based on $k_h = 0$ was observed after 13 d at pH 3, 7, 11, and 85°C (Ellington et al. 1987, 1988).

Biodegradation: $t_{1/2}$ (aq. aerobic) = 23256–50136 h, based on unacclimated aerobic soil grab sample data (Beck & Hansen 1974; Howard et al. 1991);

$t_{1/2}$ (aq. anaerobic) = 93024–200544 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Beck & Hansen 1974; Howard et al. 1991);

degradation rate constant $k = 1.9 \times 10^{-5} \text{ h}^{-1}$ in soil (Beck & Hansen 1974; selected, Mackay et al. 1985; Mackay & Paterson 1991);

not significant in an aerobic environment, and no significant degradation rate (Tabak et al. 1981; Mills et al. 1982)

$t_{1/2}$ (aerobic) = 970 d, $t_{1/2}$ (anaerobic) = 3900 d in natural waters (Capel & Larson 1995)

dechlorination pseudo-first order rate constant $k = 0.282 \text{ d}^{-1}$ with $t_{1/2} = 2.5 \text{ d}$ using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).

Bioconcentration Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 18.76 \text{ h}^{-1}$; $k_2 = 0.00238 \text{ h}^{-1}$ (trout muscle, Neely et al. 1974)

$k_1 = 10000 \text{ d}^{-1}$ (guppy, Konemann & van Leeuwen 1980)

$k_1 = 22.5 \text{ h}^{-1}$ (guppy, quoted from Konemann & van Leeuwen 1980, Hawker & Connell 1985)

$\log k_1 = 1.35 \text{ d}^{-1}$ (fish, quoted from Konemann & Leeuwen 1980, Hawker & Connell 1985)

$k_1 = 18.8 \text{ h}^{-1}$ (trout, quoted from Bruggeman, Hawker & Connell 1985, Connell & Hawker 1988)

$\log k_1 = 1.27 \text{ d}^{-1}$ (trout, quoted from Bruggeman, Hawker & Connell 1985, Connell & Hawker 1988)

$1/k_2 = 420 \text{ h}$ (trout, quoted from Bruggeman et al. 1984, Hawker & Connell 1985)

$\log k_2 = 2.62 \text{ d}^{-1}$ (fish, quoted, Hawker & Connell 1985)

$k_1 = 540 \text{ d}^{-1}$ (fish, quoted, Opperhuizen 1986)

$k_2 = 0.00510, 0.00818, 0.00640, 0.0047 \text{ d}^{-1}$ (rainbow trout, calculated-fish mean body weight, Barber et al. 1988)

$\log k_1 = 2.73 \text{ d}^{-1}$ (fish, quoted from Konemann & Leeuwen 1980, Connell & Hawker 1988)

$\log k_1 = 2.65 \text{ d}^{-1}$; $\log 1/k_2 = 1.24 \text{ d}$ (fish, quoted from Bruggeman et al. 1984, Connell & Hawker 1988)

$\log k_2 = -1.24 \text{ d}^{-1}$ (fish, calculated- K_{OW} , Thomann 1989)

$k_1 = 0.049 \text{ h}^{-1}$; $k_2 = 0.023 \text{ h}^{-1}$ (mayfly-sediment model II, Gobas et al. 1989b)

$k_2 = 0.092 \text{ d}^{-1}$ with elimination $t_{1/2} = 7.5 \text{ d}$ (earthworm, Belfroid et al. 1995)

$k_1 = 6.558 \text{ h}^{-1}$, $k_2 = 0.00429 \text{ h}^{-1}$ (Macrophytes *Myrioophyllum spicatum*, Wang et al. 1996)

$k_1 = 10489 \text{ h}^{-1}$, $k_2 = 0.424 \text{ h}^{-1}$ (algae *Chlorella fusca*, Wang et al. 1996)

$k_2 = 0.016 \text{ d}^{-1}$ with $t_{1/2} = 43 \text{ d}$ and $k_2 = 0.017 \text{ d}^{-1}$ with $t_{1/2} = 42 \text{ d}$ for food concn of 14 ng/g and 103 ng/g respectively in a 30-d uptake followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_1 = 467 \text{ mL g}^{-1} \text{ d}^{-1}$, $k_2 = 0.26 \text{ d}^{-1}$ (pond snail *Lymnaea stagnalis*, Legierse et al. 1998)

$k_1 = 8 \text{ (food lipid mg)/(g worm lipid-d)}$ (earthworm, Wågman et al. 2001)

Half-Lives in the Environment:

- Air: $t_{1/2} = 3753\text{--}37530$ h, based on estimated photooxidation half-life (Atkinson 1987, Howard et al. 1991)
 $t_{1/2} = 29 \pm 5.8$ yr at Eagle Harbor, $t_{1/2} = 15 \pm 1.9$ yr at Sleeping Bear Dunes and $t_{1/2} = 18 \pm 2.3$ yr in the Great Lakes = atmosphere at Sturgeon Point (Buehler et al. 2004).
- Surface Water: $t_{1/2} = 1.4\text{--}50$ d estimated, $t_{1/2} = 0.3\text{--}3$ d for river water and $t_{1/2} = 30\text{--}300$ d for lakes, estimated from persistence (Zoeteman et al. 1980)
 $t_{1/2} = 23256\text{--}50136$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Beck & Hansen 1974, Howard et al. 1991)
 $t_{1/2}(\text{aerobic}) = 970$ d, $t_{1/2}(\text{anaerobic}) = 3900$ d in natural waters (Capel & Larson 1995)
- Groundwater: $t_{1/2} = 30\text{--}300$ d, estimated from persistence (Zoeteman et al. 1980)
 $t_{1/2} = 46512\text{--}100272$ h, based on unacclimated aqueous aerobic biodegradation half-life (Beck & Hansen 1974, Howard et al. 1991)
- Sediment: dechlorination $t_{1/2} = 1.8$ d using a mixed enrichment culture derived from a contaminated estuarine sediment (Pavlostathis & Prytula 2000).
- Soil: $t_{1/2} > 50$ d (Ryan et al. 1988)
disappearance $t_{1/2} = 11.3$ d from testing soils (Anderson et al. 1991)
 $t_{1/2} = 23256\text{--}50136$ h, based on unacclimated aerobic soil grab sample data (Beck & Hansen 1974; Howard et al. 1991)
 $t_{1/2} = 3\text{--}6$ yr in soil (Geyer et al. 2000)
 $t_{1/2} = 48.7$ and 11.7 yr for control and sludge-amended Luddington soils, respectively (Meijer et al. 2001).
- Biota: $t_{1/2} = 163$ h, clearance from fish (Neely 1980)
 $t_{1/2} > 224$ d in rainbow trout (Niimi & Cho 1980);
 $t_{1/2} = 210$ d at 4°C , $t_{1/2} = 80$ d at 12°C , $t_{1/2} = 70$ d at 18°C in subadult rainbow trout (Niimi & Palazzo 1985)
 $t_{1/2} = 27$ d in worms at 8°C (Oliver 1987a)
biological $t_{1/2} = 12$ d in trout muscle, $t_{1/2} > 173$ d and > 224 d in trout, $t_{1/2} = 12$ d in guppy (Niimi 1987);
 $t_{1/2} = 30$ d in *picea omorika* (Reischl et al. 1989)
elimination $t_{1/2} = 1.44$ d and 12.3 d in a two-phase kinetics for earthworm in OECD soil (Belfroid et al. 1994)
elimination $t_{1/2} = 1.9\text{--}7.5$ d from earthworm in soil (Belfroid et al. 1995)
- Depuration $t_{1/2} = 42\text{--}43$ d in a 30-d dietary exposure and 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

6.1.2 CHLOROTOLUENES

6.1.2.1 2-Chlorotoluene

Common Name: 2-Chlorotoluene

Synonym: *o*-Tolylchloride, *o*-chlorotoluene, 2-chloro-1-methylbenzene

Chemical Name: 2-chlorotoluene

CAS Registry No: 95-49-8

Molecular Formula: C_7H_7Cl

Molecular Weight: 126.584

Melting Point ($^{\circ}C$):

−35.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

159.15 (Dreisbach 1955; Weast 1982–83)

159.0 (Dean 1985, 1992)

Density (g/cm^3 at $20^{\circ}C$):

1.08245, 1.07762 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955; Riddick et al. 1986)

Molar Volume (cm^3/mol):

116.9 ($20^{\circ}C$, calculated-density)

139.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

8.368 (Dreisbach 1955; Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section.):

372 (Isnard & Lambert 1989)

252.0 (shake flask, Fredenlund et al. 1995)

$117^* \pm 5.1$ (shake flask-GC/FID, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

487 (interpolated-Antoine eq., Stuckey & Saylor 1940)

$\log P/mmHg = 7.29547 - 1701.60/(T/K - 45.42)$; temp range $4-75^{\circ}C$ (Antoine eq. based on exptl. data, Hg manometer, Stuckey & Saylor 1940)

133.3*, 666.6, 1333 (5.4, 30.6, $43.2^{\circ}C$, summary of lit. data, temp range $5.4-159^{\circ}C$, Stull 1947)

482.5 (calculated by formula, Dreisbach 1955; quoted, Riddick et al. 1986, Howard 1993)

$\log (P/mmHg) = 6.94763 - 1497.2/(209.0 + t/^{\circ}C)$; temp range $65-220^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

482.5 (extrapolated-Antoine eq., Weast 1972–73)

$\log (P/mmHg) = (-0.2185 \times 10279.3)/(T/K) + 8.091764$; temp range $5.4-159.3^{\circ}C$ (Antoine eq., Weast 1972–73)

5721* ($72.654^{\circ}C$, temp range $72.654-158.323^{\circ}C$, Cervenkova & Boublik 1982)

473 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.09563 - 1507.930/(t/^{\circ}C + 209.846)$; temp range $72.5-158.3^{\circ}C$ (Antoine eq., Boublik et al. 1984)

485 (interpolated-Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 7.36797 - 1735.8/(t/^{\circ}C + 230.0)$; temp range $0-65^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log (P/mmHg) = 6.94763 - 1497.2/(t/^{\circ}C + 209.0)$; temp range: $65-220^{\circ}C$ (Antoine eq., Dean 1985, 1992)

472.0 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{Pa}) = 6.07253 - 1497.2/(T/\text{K} - 64.15)$; temp range 338–493K (liquid, Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 33.2792 - 3.4099 \times 10^3/(T/\text{K}) - 8.6743 \cdot \log (T/\text{K}) + 6.8174 \times 10^{-10} \cdot (T/\text{K}) + 1.8987 \times 10^{-6} \cdot (T/\text{K})^2$, temp range 237–656 K (Yaws 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

370* (23°C, equilibrium cell-GC, measured range 1–23°C, Leighton & Calo 1981)

$\ln (k_H/\text{atm}) = 17.18 - 3545/(T/\text{K})$; temp range: 1.0–23.0°C (equilibrium cell-concn ratio, Leighton & Calo 1981)

295 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 3.890 - 1409/(T/\text{K})$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.42 (shake flask, Leo et al. 1971, Hansch & Leo 1979, Hansch et al. 1995)

3.52 (HPLC-RT correlation, Könnemann et al. 1979)

3.40 (HPLC- k' correlation, Hanai et al. 1981)

3.59 (RP-HPLC-RT correlation, Edsforth 1986)

3.52 (recommended, Sangster 1993)

6.1.2.2 3-Chlorotoluene

Common Name: 3-Chlorotoluene

Synonym: *m*-Tolylchloride, 3-chloro-1-methylbenzene

Chemical Name: 3-chlorotoluene

CAS Registry No: 108-41-8

Molecular Formula: C_7H_7Cl

Molecular Weight: 126.584

Melting Point ($^{\circ}C$):

−47.8 (Weast 1982–83; Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

161.8 (Dean 1985; 1992; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0722 (Weast 1982–83)

1.0728 ($20^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

118.1 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

139.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

43.76 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section.):

372 (Isnard & Lambert 1989)

$117^* \pm 2.1$ (shake flask-GC/FID, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

418 (interpolated-Antoine eq., Stuckey & Saylor 1940)

$\log P/mmHg = 7.62515 - 1887.31/(T/K - 33.40)$; temp range $4-75^{\circ}C$ (Antoine eq. based on exptl. data, Hg manometer, Stuckey & Saylor 1940)

133.3^* , 666.6, 1333 (4.8, 30.3, $43.2^{\circ}C$, summary of lit. data, temp range $4.8-162.3^{\circ}C$, Stull 1947)

488.9 (extrapolated, Antoine eq., Weast 1972–73)

$\log (P/mmHg) = (-0.2185 \times 10081.1)/(T/K) + 7.952234$; temp range $4.8-162.3^{\circ}C$ (Antoine eq., Weast 1982–83)

403.0 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.09068 - 1511.858/(t/^{\circ}C + 208.119)$; temp range $64.8-159.8^{\circ}C$ (Antoine eq., Boublik et al. 1984)

670.0 (Riddick et al. 1986)

$\log (P/kPa) = 6.2794 - 1637.6/(223.3 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

512.2 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P/kPa) = 6.90317 - 2028.13/[(T/K) - 11.629]$; temp range $277-436\ K$ (liquid, Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.28 (shake flask, Leo et al. 1971, Hansch & Leo 1979)

3.40 (HPLC- k' correlation, Hanai et al. 1981)

- 3.28 (shake flask, Log P Database, Hansch & Leo 1987)
 3.17 (calculated-UNFIC activity coefficients, Dallos et al. 1993)
 3.28 (recommended, Sangster 1993)
 3.28 (recommended, 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.88 (activated carbon, Blum et al. 1994)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F : 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section.):

106.0 ($20^{\circ}C$, Yalkowsky 1987)

123 ± 6.1 (shake flask-GC/FID, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

422 (interpolated-Antoine eq., Stuckey & Saylor 1940)

$\log P/mmHg = 23.07210 - 3041.02/(T/K) - 5 \cdot \log(T/K)$; temp range $4-75^{\circ}C$ (vapor pressure eq. based on exptl. data, Ramsay-Young method-Hg manometer, Stuckey & Saylor 1940)

133.3*, 666.6, 1333 ($5.5, 31.0, 43.8^{\circ}C$, temp range $5.5-162.3^{\circ}C$, summary of lit. data, Stull 1947)

471.6 (interpolated, Antoine eq., Weast 1982–83)

$\log(P/mmHg) = (-0.2185 \times 10151.7)/(T/K + 7.988366)$; temp range $5.5-162.3^{\circ}C$ (Antoine eq., Weast 1982–83)

$\log(P/kPa) = 6.09068 - 1511.858/(t/^{\circ}C + 208.199)$; temp range $65-160^{\circ}C$ (Antoine eq., Boublik et al. 1984)

670 ($30.3^{\circ}C$, Riddick et al. 1986)

$\log(P/kPa) = 6.75005 - 1887.31/(239.75 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

506.7 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P/kPa) = 6.90317 - 2107.52/(T/K - 5.373)$; temp range $304-436\ K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 61.8901 - 4.3760 \times 10^3/(T/K) - 19.840 \cdot \log(T/K) + 7.991 \times 10^{-3} \cdot (T/K) + 1.0781 \times 10^{-13} \cdot (T/K)^2$, temp range $281-660\ K$ (Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

412.4 (calculated-P/C, Howard 1993)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 3.33 (shake flask, Leo et al. 1971; Hansch & Leo 1979; 1985)
- 3.42 (HPLC-RT correlation, Könemann et al. 1979)
- 3.40 (HPLC- k' correlation, Hanai et al. 1981)
- 3.30 (shake flask, Wang et al. 1987)
- 3.33 (recommended, Sangster 1993)
- 3.33 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:Bioconcentration Factor, $\log BCF$:

- 1.65–2.30 (estimated from $\log K_{OW}$, Lyman et al. 1990; Howard 1993)

Sorption Partition Coefficient, $\log K_{OC}$:

- 2.65–3.19 (estimated from $\log K_{OW}$, Lyman et al. 1990; Howard 1993)
- 4.10 (activated carbon, Blum et al. 1994)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: based on the Henry's law constant, the volatilization $t_{1/2} \sim 3.5$ h from a model river 1 m deep, flowing 1 m/s with a wind speed of 3 m/s (Lyman et al. 1990; quoted, Howard 1993).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 8.4$ d in the atmosphere with rate constant $k = 1.9 \times 10^{-12}$ cm³/molecule·s at 25°C for the reaction with photochemically produced hydroxyl radicals (Atkinson 1987; quoted, Howard 1993).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 8.4$ d in the atmosphere for the reaction with photochemically produced hydroxyl radical (Atkinson 1987; quoted, Howard 1993).

Surface water: $t_{1/2} = 1.2$ d in surface waters in case a first order reduction process may be assumed (Zoeteman et al. 1980)

22.3, 23.1, 25.9, 32, 36.6 (5, 15, 25, 35, $45^{\circ}C$, generator column-GC, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

55.5 (Riddick et al. 1986)

$\log(P/kPa) = 5.6199 - 1330.4/(t/^{\circ}C + 168.5)$ (Antoine eq., Riddick et al. 1986)

55.51 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 5.6199 - 1330.4/(T/K - 104.65)$; temp range 346–475 K (Antoine eq., Stephenson & Malanowski 1987)

61.06 (Daubert & Danner 1989)

$\log(P/mmHg) = 31.9325 - 3.7438 \times 10^3/(T/K) - 8.0123 \cdot \log(T/K) - 7.5077 \times 10^{-11} \cdot (T/K) + 1.250 \times 10^{-6} \cdot (T/K)^2$, temp range 260–705 K (Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

350.6 (calculated, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.24 (HPLC-RT correlation, Könemann et al. 1979)

4.24 (recommended, Sangster 1993)

4.24 (shake flask, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.99 (estimated from $\log K_{OW}$, Howard 1997)

Sorption Partition Coefficient, $\log K_{OC}$:

3.68 (estimated from $\log K_{OW}$, Howard 1997)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 4.0$ h in a model river 1-m deep with a 1 m/s current and a 3 m/s wind, $t_{1/2} = 1$ d in the Rhine River in the Netherlands (Howard 1997)

Photolysis:

Oxidation: photooxidation $t_{1/2} = 11.6$ d in the atmosphere for the reaction with photochemically produced hydroxyl radical (Howard 1997).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 11.6$ d in the atmosphere for the reaction with photochemically produced hydroxyl radical (Howard 1997).

Surface water: $t_{1/2} = 1.0$ d in surface waters in case a first order reduction process may be assumed (Zoeteman et al. 1980)

volatilization $t_{1/2} = 4$ h in a model river, $t_{1/2} = 1$ d in Rhine River in the Netherlands (Howard 1993)

6.1.2.5 2,6-Dichlorotoluene

Common Name: 2, 6-Dichlorotoluene

Synonym:

Chemical Name: 2, 6-dichlorotoluene

CAS Registry No: 118-69-4

Molecular Formula: $C_7H_6Cl_2$

Molecular Weight: 161.029

Melting Point ($^{\circ}C$): liquid

25.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

198 (Weast 1982–83, Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.254 (Dean 1992)

1.2686 (Lide 2003)

Molar Volume (cm^3/mol):

126.9 ($20^{\circ}C$, calculated-density)

160.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

23.3 ± 0.81 (shake flask-GC/FID, Ma et al. 2001)

16.7, 19.8, 23.3, 30.1, 33 (5, 15, 25, 35, $45^{\circ}C$, shake flask-GC, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

53.19 (estimated, Lyman et al. 1990, Howard 1997)

Henry's Law Constant ($Pa \cdot m^3/mol$):

350.6 (Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.29 (HPLC- k' correlation, Könnemann et al. 1979)

4.29 (recommended, Sangster 1983)

4.29 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.03 (estimated from $\log K_{ow}$, Howard 1997)

Sorption Partition Coefficient, $\log K_{OC}$:

3.71 (estimated from $\log K_{ow}$, Howard 1997)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: based on Henry's law constant, an estimated $t_{1/2} = 4.0$ h of volatilization from a model river 1 m deep with a 1 m/s current and a 3 m/s wind (Howard 1997).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 11.6$ d in the atmosphere for reaction with photochemically produced hydroxyl radical (Howard 1997).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 11.6$ d in the atmosphere for the reaction with photochemically produced hydroxyl radical (Howard 1997).

6.1.2.6 3,4-Dichlorotoluene

Common Name: 3, 4-Dichlorotoluene

Synonym: 3, 4-dichloro-1-methylbenzene

Chemical Name:

CAS Registry No: 95-75-0

Molecular Formula: $C_7H_6Cl_2$

Molecular Weight: 161.029

Melting Point ($^{\circ}C$):

-15.2 (Weast 1982-83; Lide 2003)

Boiling Point ($^{\circ}C$):

208.9 (Weast 1982-83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.25256, 1.24751 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955; Riddick et al. 1986)

1.2564 (Weast 1982-83; Lide 2003)

Molar Volume (cm^3/mol):

127.9 (calculated-density, Stephenson & Malanowski 1987)

160.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

13.33, 10.13 ($25^{\circ}C$, bp, Dreisbach 1955; Riddick et al. 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.544 (Dreisbach 1955)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

26 ($30^{\circ}C$, Dreisbach 1955; IUPAC Solubility Data Series, Horvath & Getzen 1985; Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equations):

42 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 6.97925 - 1655.4/(195.0 + t/^{\circ}C)$; temp range $105-270^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

$\log(P/mmHg) = 6.91048 - 946.35/(246.68 + t/^{\circ}C)$; temp range -87 to $7^{\circ}C$ (Antoine eq., Dean 1985, 1992)

42.0 (Riddick et al. 1986)

$\log(P/kPa) = 6.10415 - 1655.44/(195.0 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

$\log(P_L/kPa) = 6.10415 - 1655.4/(T/K - 78.15)$; temp range $378-543 K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.067 (Verhaar et al. 1992)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

6.1.2.7 2,3,6-Trichlorotoluene

Common Name: 2, 3, 6-Trichlorotoluene

Synonym:

Chemical Name: 2, 3, 6-trichlorotoluene

CAS Registry No: 2077-46-5

Molecular Formula: $C_7H_5Cl_3$

Molecular Weight: 195.474

Melting Point ($^{\circ}C$):

45–46 (Weast 1982–83)

Boiling Point ($^{\circ}C$):

229.5 (Weast 1982–83)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

180.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.629 (mp at $45.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.08 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 5.6249 - 1323/(T/K - 144.15)$; temp range 384–509 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

152 (gas stripping-GC, Oliver 1985)

245 (calculated-bond contribution method, Meylan & Howard 1991)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.80 (calculated as per Hansch & Leo 1979, Oliver 1987b)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: elimination $t_{1/2} < 5$ d, observed and corrected for growth dilution in oligochaete worms (Oliver 1987b)

6.1.2.8 2,4,5-Trichlorotoluene

Common Name: 2, 4, 5-Trichlorotoluene

Synonym: 2, 4, 5-TCT

Chemical Name: 2, 4, 5-trichlorotoluene

CAS Registry No: 6639-30-1

Molecular Formula: $C_7H_5Cl_3$

Molecular Weight: 195.474

Melting Point ($^{\circ}C$):

82.4 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

231 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1004 (Lide 2003)

Molar Volume (cm^3/mol):

115.0 ($20^{\circ}C$, calculated-density)

180.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.273 (mp at $82.4^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

2.33 ± 0.22 (shake flask-GC/FID, Ma et al. 2001)

1.10, 1.38, 2.33, 3.33, 5.64 (5, 15, 25, 35, $45^{\circ}C$, shake flask-GC, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

152 (gas stripping-GC, Oliver 1985)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.82 (calculated- π method of Hansch & Leo 1979, Oliver & Niimi 1984, 1985)

4.80 (Oliver & Niimi 1985)

4.780 (Verhaar et al. 1992)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.68 (rainbow trout, Oliver & Niimi 1984; Oliver 1987)

3.54–3.99 with mean value of 3.88; 3.52–4.04 with mean value of 3.93 (rainbow trout, wet wt., $15^{\circ}C$, steady-state BCF on 7- to 96-d laboratory study on two tanks of different water concn, Oliver & Niimi 1985)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air:

Surface water: $t_{1/2} = 1.8$ d in surface waters in case a first order reduction process may be assumed (Zoeteman et al. 1980)

Groundwater:

Sediment:

Soil:

Biota: elimination $t_{1/2} < 5$ d, observed and corrected for growth dilution in oligochaete worms (Oliver 1987b).

6.1.2.9 α -Chlorotoluene

Common Name: α -Chlorotoluene

Synonym: chloromethylbenzene, benzyl chloride

Chemical Name:

CAS Registry No: 100-44-7

Molecular Formula: C_7H_7Cl , $C_6H_5CH_2Cl$

Molecular Weight: 126.584

Melting Point ($^{\circ}C$):

−45 (Lide 2003)

Boiling Point ($^{\circ}C$):

179 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

118.0 (calculated-density, Stephenson & Malanowski 1987)

139.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

493 ($20^{\circ}C$, Riddick et al. 1986)

579 (calculated-fragment const., Wakita et al. 1986)

236 (calculated-group contribution, Kühne et al. 1995)

409 ($20^{\circ}C$, limiting activity coeff. by equilibrium air stripping-GC, Hovorka & Dohnal 1997)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($22.0^{\circ}C$, summary of lit. data, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 11158.7/(T/K)] + 8.290189$; temp range $22-179.4^{\circ}C$ (Antoine eq., Weast 1972–73)

641* ($47.84^{\circ}C$, isoteniscope method, measured range $47.84-117.08^{\circ}C$, Ashcroft 1976)

$\log(P/mmHg) = 6.801 - 1477/(216.9 + t/^{\circ}C)$; temp range $48-117^{\circ}C$ (isoteniscope method, Ashdroft 1976)

641 (Riddick et al. 1986)

$\log(P/kPa) = 5.926 - 1477/(193.7 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

170 (interpolated-Anotine eq., Stephenson & Malanowski 1987)

$\log(P/kPa) = 6.7176 - 1954.13/(T/K - 38.02)$; temp range $295-453$ K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/kPa) = 7.73903 - 2642.08/(T/K + 12.819)$; temp range $320-390$ K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 12.1503 - 2.9139 \times 10^3/(T/K) - 0.3712 \cdot \log(T/K) - 5.2889 \times 10^{-3} \cdot (T/K) + 2.6296 \times 10^{-6} \cdot (T/K)^2$, temp range $234-686$ K (Yaws 1994)

133.05* ($24.05^{\circ}C$, transpiration method, measured range $276-309$ K, Krasnykh et al. 2002)

$\ln(P/Pa) = 281.417/R - 71588.799/R(T/K) - (72.0/R) \cdot \ln[(T/K)/298.15]$; temp range $276-309$ K (transpiration method, Krasnykh et al. 2002)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

159.4, 122, 178, 216, 243.5, 320, 322, 370 (1.0, 3.0, 12.4, 12.5, 17.9, 19.1, 22.7, $23.0^{\circ}C$, equilibrium cell-concn ratio-GC/FID, Leighton & Calo 1981)

$\ln(k_H/atm) = 17.18 - 3545/(T/K)$; temp range $1.0-23.0^{\circ}C$ (equilibrium cell-concn ratio, Leighton & Calo 1981)

36.07 ($20^{\circ}C$, equilibrium air stripping-GC, Hovorka & Dohnal 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{O_3} < 0.04 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K with a tropospheric lifetimes $\tau > 290 \text{ d}$ and $\tau \sim 3 \text{ d}$ due to reactions with O_3 and OH radical at room temp. (Atkinson et al. 1982)

$k_{OH} = (2.95 \pm 0.15) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a atmospheric lifetime $\tau = 3.9 \text{ d}$ at room temp. (relative rate method, Edney et al. 1986)

$k_{OH}(\text{calc}) = 2.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs}) = 2.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH} = 2.90 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$t_{1/2} = 22\text{--}218 \text{ h}$, based on photooxidation half-life in air (Howard et al. 1991)

Hydrolysis: rate constant $k = 1.28 \times 10^{-5} \text{ s}^{-1}$ and $t_{1/2} = 15 \text{ h}$ at 25°C and pH 7 (Mabey & Mill 1978)

neutral rate constant $k = 8.5 \pm 0.5 \text{ min}^{-1}$ at 25°C (Ellington et al. 1988)

$t_{1/2} = 25\text{--}290 \text{ h}$ based on overall hydrolysis rate constant (Howard et al. 1991)

Biodegradation: $t_{1/2}(\text{aerobic}) = 168\text{--}672 \text{ h}$, based on unacclimated aqueous screening test data; $t_{1/2}(\text{anaerobic}) = 672\text{--}2688 \text{ h}$, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: tropospheric lifetimes $\tau > 290 \text{ d}$ and $\tau \sim 3 \text{ d}$ due to reactions with O_3 and OH radical, respectively, at room temp. (Atkinson et al. 1982);

calculated atmospheric lifetime $\tau = 3.9 \text{ d}$ due to reaction with OH radical at room temp. (Edney et al. 1986)

$t_{1/2} = 22\text{--}218 \text{ h}$, based on photooxidation half-life in air (Howard et al. 1991)

Surface water: $t_{1/2} = 15\text{--}290 \text{ h}$, based on estimated hydrolysis half-lives (Howard et al. 1991)

Groundwater: $t_{1/2} = 15\text{--}290 \text{ h}$, based on estimated hydrolysis half-lives (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 15\text{--}290 \text{ h}$, based on estimated hydrolysis half-lives (Howard et al. 1991)

Biota:

FIGURE 6.1.2.9.1 Logarithm of vapor pressure versus reciprocal temperature for α -chlorotoluene.

6.1.2.10 α, α, α -Trichlorotoluene

Common Name: α, α, α -Trichlorotoluene

Synonym: trichloromethylbenzene, benzotrichloride

Chemical Name: α, α, α -Trichlorotoluene

CAS Registry No: 98-07-7

Molecular Formula: $C_7H_5Cl_3$, $C_6H_5CCl_3$

Molecular Weight: 195.474

Melting Point ($^{\circ}C$):

−4.42 (Lide 2003)

Boiling Point ($^{\circ}C$):

221 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.3723 ($20^{\circ}C$, Lide 2003)

Molar Volume (cm^3/mol):

142.4 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

180.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

5.30 ($5^{\circ}C$, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (45.8, summary of lit. data, Stull 1947)

$\log (P/mmHg) = [-0.2185 \times 8869.7/(T/K)] + 8.071972$, temp range $32-102.2^{\circ}C$ (Antoine eq., Weast 1972–73)

34.67 (extrapolated, Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.95923 - 2268.82/(T/K - 28.669)$; temp range $318-487 K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/mmHg) = 0.4912 - 2.7285 \times 10^3/(T/K) + 4.4706 \cdot \log (T/K) - 1.058 \times 10^{-2} \cdot (T/K) + 4.7621 \times 10^{-6} \cdot (T/K)^2$; temp range $268-737 K$ (Yaws 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.92 (shake flask, Leo et al. 1979, Hansch & Leo 1979, Hansch et al. 1995; quoted, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $t_{1/2} = 173.7-1737 h$, based on photooxidation half-life in air (Howard et al. 1991)

Hydrolysis: rate constant $k = 6.3 \times 10^{-2} s^{-1}$ and $t_{1/2} = 19 s$ at $25^{\circ}C$ and pH 7 (Mabey & Mill 1978)

$t_{1/2} = 11 s - 3 min$, based on overall hydrolysis rate constants (Howard et al. 1991)

Biodegradation: $t_{1/2}$ (aerobic) = 24–168 h, based on limited aqueous screening test data; $t_{1/2}$ = 96–672 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2}$ = 173.7–1737 h, based on photooxidation half-life in air (Howard et al. 1991)

Surface water: $t_{1/2}$ = 11 s – 3.0 min, based on measured hydrolysis rate constants (Howard et al. 1991)

Groundwater: $t_{1/2}$ = 11 s – 3.0 min, based on measured hydrolysis rate constants (Howard et al. 1991)

Sediment:

Soil: $t_{1/2}$ = 11 s – 3.0 min, based on measured hydrolysis rate constants (Howard et al. 1991)

6.1.2.11 Pentachlorotoluene

Common Name: Pentachlorotoluene

Synonym:

Chemical Name: pentachlorotoluene

CAS Registry No: 877-11-1

Molecular Formula: $C_7H_3Cl_5$

Molecular Weight: 264.364

Melting Point ($^{\circ}C$):

224.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

301 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

222.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.011 (mp at $224.8^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.028 ± 0.001 , 0.047 ± 0.004 (25, $35^{\circ}C$, shake flask-GC, Ma et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.20 (calculated as per Hansch & Leo 1979, Oliver & Niimi 1985; Oliver 1987b)

5.50 (assumed to have approx. the same K_{ow} of HCB, Oliver & Charlton 1984)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ at $25^{\circ}C$ or as indicated:

3.38–3.86 mean 3.83 (rainbow trout, wet wt., $15^{\circ}C$, steady-state BCF, 7- to 96-d laboratory study, Oliver & Niimi 1985)

3.83; 4.36 (rainbow trout, laboratory data; Lake Ontario field data, Oliver & Niimi 1985)

4.45; 3.83 (oligochaete worm; fish, Oliver 1987b)

Sorption Partition Coefficient, $\log K_{OC}$:

5.30 (field data of sediment trap material; Oliver & Charlton 1984)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: elimination $t_{1/2} = 22$ and 26 d, observed and corrected for growth dilution, respectively, in oligochaete worms (Oliver 1987b)

6.1.2.12 *o*-Chlorostyrene

Common Name: *o*-Chlorostyrene

Synonym: *o*-chlorovinylbenzene, 2-chlorostyrene

Chemical Name: *o*-chlorostyrene

CAS Registry No: 2039-87-4

Molecular Formula: C₈H₇Cl

Molecular Weight: 138.595

Melting Point (°C):

−63.1 (Lide 2003)

Boiling Point (°C):

188.7 (Dreisbach 1955, Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm³):

1.10001, 1.09532 (20°C, 25°C, Dreisbach 1955)

Molar Volume (cm³/mol):

126.0 (20°C, calculated-density, Stephenson & Malanowski 1987)

153.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

51.03, 40.01 (25°C, bp, Dreisbach 1955)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

127.5 (calculated by formula, Dreisbach 1955)

log (P/mmHg) = 6.86644 − 1542.1/(198 + t/°C); temp range 90–250°C (Antoine eq. for liquid state, Dreisbach 1955)

log (P/kPa) = 6.11856 − 1627.284/(207.112 + t/°C); temp range 98.5–154.9°C (Antoine eq. derived from experimental data of Dreisbach & Shrader 1949, Boublik et al. 1984)

log (P_L/kPa) = 5.99134 − 1541.1/(−75.15 + T/K); temp range 363–543 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m³/mol at 25°C):

Octanol/Water Partition Coefficient, log K_{ow}:

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF or log K_B:

Sorption Partition Coefficient, log K_{OC}:

Environmental Fate Rate Constants, k, and Half-Lives, t_{1/2}:

Half-Lives in the Environment:

6.1.2.13 *m*-Chlorostyrene

Common Name: *m*-Chlorostyrene

Synonym: *m*-chlorovinylbenzene, 3-chlorostyrene

Chemical Name: *m*-chlorostyrene

CAS Registry No: 2039-85-2

Molecular Formula: C₈H₇Cl

Molecular Weight: 138.595

Melting Point (°C):

Boiling Point (°C):

Density (g/cm³):

1.1033 (20°C, Lide 2003)

Molar Volume (cm³/mol):

124.1 (20°C, calculated-density, Stephenson & Malanowski 1987)

153.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

Vapor Pressure (Pa at 25°C or as indicated and the reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* (25.3°C, summary of literature data, Stull 1947)

148.06 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.83847 – 2156.77/(–16.882 + T/K); temp range 298–463 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m³/mol at 25°C):

Octanol/Water Partition Coefficient, log K_{ow}:

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF or log K_B:

Sorption Partition Coefficient, log K_{OC}:

Environmental Fate Rate Constant, k, and Half-Lives, t_{1/2}:

Half-Lives in the Environment:

6.1.2.14 *p*-Chlorostyrene

Common Name: *p*-Chlorostyrene

Synonym: *p*-chlorovinylbenzene, 4-chlorostyrene

Chemical Name: *p*-chlorostyrene

CAS Registry No: 1073-67-2

Molecular Formula: C₈H₇Cl

Molecular Weight: 138.595

Melting Point (°C):

−15.9 (Dreisbach 1955, Stephenson & Malanowski 1987; Lide 2003)

Boiling Point (°C):

192.0 (Dreisbach 1955, Lide 2003)

Density (g/cm³):

1.08682, 1.08214 (20°C, 25°C, Dreisbach 1955)

1.0868 (20°C, Lide 2003)

Molar Volume (cm³/mol):

127.5 (20°C, calculated-density, Stephenson & Malanowski 1987)

153.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

51.11, 40.07 (25°C, bp, Dreisbach 1955)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* (28.0°C, summary of literature data, temp range 28.0–191.0°C, Stull 1947)

6287* (100.91°C, ebulliometry, measured range 100.91–127.27°C, Dreisbach & Shrader 1949)

116.3 (calculated by formula, Dreisbach 1955)

log (P/mmHg) = 6.84248 – 1545.0/(198 + t/°C); temp range 90–250°C (Antoine eq. for liquid state, Dreisbach 1955)

log (P/kPa) = 9.18404 – 4186.871/(398.256 + t/°C); temp range 100.9–127.27°C (Antoine eq. derived from experimental data of Dreisbach & Shrader 1949, Boublik et al. 1984)

log (P_L/kPa) = 5.96738 – 1545.0/(−75.15 + T/K); temp range 363–523 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m³/mol at 25°C):

Octanol/Water Partition Coefficient, log K_{ow}:

3.66 (estimated, Kaiser 1987)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF or log K_B:

Sorption Partition Coefficient, log K_{OC}:

Environmental Fate Rate Constant, k, and Half-Lives, t_{1/2}:

Half-Lives in the Environment:

6.1.2.15 Octochlorostyrene

Common Name: Octochlorostyrene

Synonym:

Chemical Name: octachlorostyrene

CAS Registry No: 29082-74-4

Molecular Formula: C_8Cl_8

Molecular Weight: 379.710

Melting Point ($^{\circ}C$):

99 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

300.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.188 (mp at $99^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

22.9($20^{\circ}C$, calculated-bond contribution method, Meylan & Howard 1991)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.29 (HPLC-RT correlation, Veith et al.1979b)

6.20 (HPLC-RT correlation, Veith et al. 1979a)

Bioconcentration Factor, $\log BCF$:

4.52 (fathead minnow, 32-d exposure, Veith et al. 1979b)

2.91–3.91, mean 3.91 (rainbow trout, $15^{\circ}C$, wet wt., steady-state BCF on 7- to 96-d laboratory study; Oliver & Niimi 1985)

5.38; 6.15 (rainbow trout, calculated- K_{ow} , Lake Ontario field BCF, Oliver & Niimi 1985)

4.49; 3.91 (oligochaete worms; fish, Oliver 1987b)

Sorption Partition Coefficient, $\log K_{oc}$:

6.10 (field data of sediment trap material, Oliver & Charlton 1984)

5.90–7.30; 6.60 (suspended sediment: range; mean, Oliver 1987a)

6.30 (algae $> 50 \mu m$, mean, Oliver 1987a)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: elimination $t_{1/2} = 71$ d, observed and $t_{1/2} = 100$ d, corrected for growth dilution in worms ($8^{\circ}C$, Oliver 1987).

6.1.3 FLUOROBENZENES

6.1.3.1 Fluorobenzene

Common Name: Fluorobenzene

Synonym: phenyl fluoride

Chemical Name: fluorobenzene, phenyl fluoride

CAS Registry No: 462-06-6

Molecular Formula: C_6H_5F

Molecular Weight: 96.102

Melting Point ($^{\circ}C$):

−42.18 (Lide 2003)

Boiling Point ($^{\circ}C$):

84.73 (Riddick et al. 1986; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0225 (Horvath 1982; Lide 2003)

1.0131 ($30^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

94.4 (Stephenson & Malanowski 1987; Wang et al. 1992)

101.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

11.305 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1540 ($30^{\circ}C$, shake flask-IR, Gross et al. 1933)

1550 (shake flask-UV spectrophotometer, Andrews & Keefer 1950)

1296 (Deno & Berkheimer 1960)

922 (shake flask-GC, Jones et al. 1977/1978)

189.3* (shake flask-GC, measured range $5-45^{\circ}C$, Nelson & Smit 1978)

1559 (Yalkowsky et al. 1979; Yalkowsky & Valvani 1980)

1540 ($27.5^{\circ}C$, recommended, IUPAC Solubility Data Series, Horvath & Getzen 1985)

1530 ($30^{\circ}C$, Riddick et al. 1986)

1700*, 1550 ($19.2^{\circ}C$, $29.7^{\circ}C$, shake flask-GC/TC, measured range $0-80^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

10246* ($24.9^{\circ}C$, Ramsay-Young method, measured range -17.85 to $83.85^{\circ}C$, Young 1889)

7999* ($19.6^{\circ}C$, summary of literature data, temp range -43.4 to $84.7^{\circ}C$, Stull 1947)

19920* ($39.4^{\circ}C$, comparative ebulliometry, measured range $39.4-120.5^{\circ}C$, Scott et al. 1956)

$\log(P/mmHg) = 6.95208 - 1248.083/(221.827 + t/^{\circ}C)$; temp range $34.5-120.5^{\circ}C$ (Antoine eq., comparative ebulliometry, Scott et al. 1956)

$\log(P/mmHg) = [-0.2185 \times 7980.4/(T/K)] + 7.699237$; temp range $-43.4-279.3^{\circ}C$ (Antoine eq., Weast 1972-73)

10200 (interpolated-Antoine eq., Boublik et al. 1973, 1984)

$\log(P/mmHg) = 7.18703 - 1381.828/(235.563 + t/^{\circ}C)$; temp range -17.85 to $83.85^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1973)

$\log(P/kPa) = 6.31155 - 1381.646/(235.548 + t/^{\circ}C)$; temp range -17.85 to $83.85^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 7.1870 - 1381.8/(235.6 + t/^{\circ}\text{C})$; temp range -18 to 84°C (Antoine eq., Dean 1985, 1992)
10480 (Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.07698 - 1248.083/(221.827 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)

$\log (P_L/\text{kPa}) = 6.07234 - 1245.564/(-51.587 + T/\text{K})$; temp range 312–394 K, (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.4113 - 1398.61/(-31.295 + T/\text{K})$; temp range 358–530 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.14135 - 1291.116/(-45.664 + T/\text{K})$; temp range 373–419 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.37857 - 1478.807/(-18.847 + T/\text{K})$; temp range 414–501 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.59182 - 2876.741/(171.093 + T/\text{K})$; temp range 497–561 K (Antoine eq.-V, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -5.4849 - 1.8597 \times 10^3/(T/\text{K}) + 7.1515 \cdot \log (T/\text{K}) - 1.6467 \times 10^{-2} \cdot (T/\text{K}) + 9.2622 \times 10^{-6} \cdot (T/\text{K})^2$, temp range 231–560 K (Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

632 (computer value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.27 (shake flask-AS, Fujita et al. 1964; Hansch et al. 1968; Leo et al. 1971)

2.28 (calculated-fragment const., Rekker 1977)

2.27 (recommended, Sangster 1989, 1993)

2.26 (centrifugal partition chromatography, El Tayar et al. 1991)

2.27 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{OH}(\text{calc}) = 2.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs}) = 0.54 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (6.31 \pm 0.84) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 234–438 K (flash photolysis-resonance fluorescence, Wallington et al. 1987)

$k_{OH} = 6.31 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 1.7 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988a)

$k_{OH} = 6.90 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, independent of temperature over the range 234–303 K (Atkinson 1989)

$k_{OH}(\text{calc}) = 1.08 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

FIGURE 6.1.3.1.2 Logarithm of vapor pressure versus reciprocal temperature for fluorobenzene.

6.1.3.2 1,2-Difluorobenzene

Common Name: 1,2-Difluorobenzene

Synonym: *o*-difluorobenzene

Chemical Name: 1,2-Difluorobenzene

CAS Registry No: 367-11-3

Molecular Formula: C₆H₄F₂

Molecular Weight: 114.093

Melting Point (°C):

−47.1 (Lide 2003)

Boiling Point (°C):

94 (Lide 2003)

Density (g/cm³ at 20°C):

1.158 (Dean 1992)

Molar Volume (cm³/mol):

99.2 (calculated-density, Stephenson & Malanowski 1987)

106.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

1141 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980; Yalkowsky et al. 1983)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

9582* (31.17°C, comparative ebulliometry, measured range 31–130°C, Scott et al. 1963)

log (P/kPa) = 6.12360 – 1297.243/(211.103 + t/°C); temp range 31.2–130°C (Antoine eq. derived from experimental data of Scott et al. 1963, Boublik et al. 1984)

Henry's Law Constant (Pa·m³/mol at 25°C):

713 (computer value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, log K_{ow}:

2.59 (calculated-fragment const., Valvani & Yalkowsky 1980)

2.58 (calculated-fragment const., Yalkowsky et al. 1983)

2.56 (calculated-molar volume correlation, Wang et al. 1992)

2.43 (calculated, Müller & Klein 1992)

2.37 (recommended, Hansch et al. 1995)

2.25; 2.33 (predicted; calc-atom typing scheme, Inel & Iseri 1997)

Octanol/Air Partition Coefficient, log K_{oa}:

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{oc}:

Environmental Fate Rate Constants, k or Half-Lives, t_{1/2}:

Half-Lives in the Environment:

FIGURE 6.1.3.8.1 Logarithm of vapor pressure versus reciprocal temperature for 1,2,3,5-tetrafluorobenzene.

6.1.3.9 1,2,4,5-Tetrafluorobenzene

Common Name: 1,2,4,5-Tetrafluorobenzene

Synonym:

Chemical Name: 1,2,4,5-tetrafluorobenzene

CAS Registry No: 327-54-8

Molecular Formula: $C_6H_2F_4$

Molecular Weight: 150.074

Melting Point ($^{\circ}C$):

3.88 (Lide 2003)

Boiling Point ($^{\circ}C$):

90.2 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.4255 (Lide 2003)

Molar Volume (cm^3/mol):

105.3 ($20^{\circ}C$, calculated-density)

105.4 (calculated-density, Stephenson & Malanowski 1987)

116.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

32.9 (Ambrose et al. 1975)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

7556* (interpolated from ebulliometric measurements, Ambrose et al. 1975)

$\log(P/kPa) = 6.17340 - 1277.452/(-56.889 + T/K)$; temp range 293.2–363.413 (normal bp) K (Antoine eq.-I from ebulliometric measurements, Ambrose et al. 1975)

$\log(P/kPa) = 6.17788 - 1279.904/(-56.642 + T/K)$; temp range 293.2–387.6 K (Antoine eq.-II from ebulliometric measurements, Ambrose et al. 1975)

$\log(P/kPa) = 6.17439 - 1277.918/(216.289 + t/^{\circ}C)$; temp range 20.05 – $114.42^{\circ}C$ (Antoine eq. derived from Ambrose et al. 1975 data, Boublik et al. 1984)

$\log(P_L/kPa) = 6.17614 - 1278.93/(-56.748 + T/K)$; temp range 293–390 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.42009 - 1454.406/(-33.675 + T/K)$; temp range 390–488 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.88521 - 3090.851/(174.387 + T/K)$; temp range 488–543 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

$\log(P/kPa) = 6.14363 - 1220.148/(214.610 + t/^{\circ}C)$; temp range 37.3 – $88.8^{\circ}C$ (Antoine eq. derived from Counsell et al. 1965 data, Boublik et al. 1984)

$\log(P/kPa) = 6.15013 - 1223.989/(215.084 + t/^{\circ}C)$; temp range 17 – $104^{\circ}C$ (Antoine eq. derived from Ambrose 1981 data, Boublik et al. 1984)

10733 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.14213 - 1219.41/(214.55 + t/^{\circ}C)$; temp range not specified (Antoine eq., Riddick et al. 1986)

$\log(P_s/kPa) = 11.49514 - 3518.13/(44.44 + T/K)$; temp range 215 – $278 K$ (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.15233 - 1224.974/(-57.984 + T/\text{K})$; temp range 278–354 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.19544 - 1251.177/(-54.775 + T/\text{K})$; temp range 348–389 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -38.8085 - 1.3422 \times 10^3/(T/\text{K}) + 22.204 \cdot \log (T/\text{K}) - 3.8813 \times 10^{-221} \cdot (T/\text{K}) + 2.10 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 278–517 K (vapor pressure eq., Yaws et al. 1994)

Henry's Law Constant ($\text{Pa} \cdot \text{m}^3/\text{mol}$ at 25°C):

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

2.22 (shake flask, Log P Database, Hansch & Leo 1987)

2.22 (recommended, Sangster 1993)

2.54 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$ or $\log K_{\text{B}}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = 1.7 \times 10^{-5} \text{ h}^{-1}$, $1.32 \times 10^{-4} \text{ h}^{-1}$, with H_2O_2 under photolysis at 25°C in F-113 solution and with HO in the gas (Dilling et al. 1988).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}} = 2.19 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Ravishankara et al. 1978)

$k_{\text{OH}}(\text{obs}) = 2.19 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{\text{OH}}(\text{calc}) = 1.8 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1985)

$k_{\text{OH}}^* = (1.61 \pm 0.24) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 234–438 K (flash photolysis-resonance fluorescence, Wallington et al. 1987)

$k_{\text{OH}}^* = 1.72 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Half-Lives in the Environment:

6.1.3.12 Pentafluorotoluene

Common Name: Pentafluorotoluene

Synonym: 2, 3, 4, 5, 6-pentafluorotoluene

Chemical Name: 2, 3, 4, 5, 6-pentafluorotoluene

CAS Registry No: 771-56-2

Molecular Formula: $C_7H_3F_5$, $C_6(CH_3)F_5$

Molecular Weight: 182.091

Melting Point ($^{\circ}C$):

-29.78 (Lide 2003)

Boiling Point ($^{\circ}C$):

117.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.440 (Lide 2003)

Molar Volume (cm^3/mol):

126.5 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

143.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

35.19 (Ambrose 1968)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5056* ($39.164^{\circ}C$, ebulliometry, measured range 39 – $138^{\circ}C$ or pressure range 30 – 1500 mmHg, Ambrose 1968)

$\log(P/\text{mmHg}) = 7.07209 - 1384.062/(212.731 + t/^{\circ}C)$; temp range ~ 76 – $127^{\circ}C$ or pressure range 200 – 1000 mmHg (Antoine eq. from ebulliometric measurements, Ambrose 1968)

$\log(P/\text{mmHg}) = 7.09119 - 1388.288/(213.646 + t/^{\circ}C)$; temp range 39 – $138^{\circ}C$ or pressure range 30 – 1500 mmHg (Antoine eq. from ebulliometric measurements, Ambrose 1968)

$\log(P/\text{mmHg}) = 13.68523 - 2813.814/(T/K) - 1.2691 \times 10^{-2} \cdot (T/K) + 0.8888 \cdot 10^{-5} \cdot (T/K)^2$; temp range 39 – $138^{\circ}C$ (Cragoe eq., ebulliometry, Ambrose 1968)

$\log(P_L/\text{kPa}) = 6.19445 - 1382.934/(-60.494 + T/K)$; temp range 312 – 416 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.21241 - 1394.345/(-59.194 + T/K)$; temp range 348 – 401 K (Antoine eq.-II, Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Common Name: Bromobenzene

Synonym: phenyl bromide

Chemical Name: bromobenzene

CAS Registry No: 108-86-1

Molecular Formula: C_6H_5Br

Molecular Weight: 157.008

Melting Point ($^{\circ}C$):

-30.72 (Dean 1985; Lide 2003)

Boiling Point ($^{\circ}C$):

156.06 (Dreisbach & Martin 1949; Dreisbach 1955; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):1.4950, 1.48824 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

1.4950 (Weast 1982-83; Lide 2003)

1.4952 (Dean 1985)

Molar Volume (cm^3/mol):105.0 ($20^{\circ}C$, calculated-density, Chiou 1985)

119.3 (Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.63 (Dreisbach 1955)

10.70 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

446 ($30^{\circ}C$, shake flask-IR, Gross & Saylor 1931)

410 (shake flask-UV, Andrews & Keefer 1950)

462 (shake flask-interferometry, Donahue & Bartell 1952)

328 (Deno & Berkheimer 1960)

458.5 ($35^{\circ}C$, shake flask-UV spectrophotometry, Hine et al. 1963)457* (shake flask-spectrophotometry, measured range $10-35^{\circ}C$, Vesala 1973)

446 (shake flask-UV, Vesala 1974)

148* (shake flask-GC, measured range $5-45.5^{\circ}C$, Nelson & Smit 1978)

360 (shake flask-UV, Yalkowsky et al. 1979)

274* (summary of literature data, temp range $25-40^{\circ}C$, Horvath 1982)

411 (generator column-HPLC/UV, Wasik et al. 1983)

330 (headspace-GC, McNally & Grob 1984)

445* (recommended, temp range $10-40^{\circ}C$, IUPAC Solubility Data Series, Horvath & Getzen 1985)

$S/(g/kg) = 1.8293 - 1.35675 \times 10^{-2} \cdot (T/K) + 2.99322 \times 10^{-5} \cdot (T/K)^2$; temp range 288-308 K (regression of literature data, IUPAC Solubility Data Series, Horvath & Getzen 1985)

384* ($20^{\circ}C$, limiting activity coeff. by equilibrium air stripping-GC, temp range $10-50^{\circ}C$, Hovorka & Dohnal 1997)

384* (estimated- RP-HPLC- k' correlation, measured range $5-35^{\circ}C$, Finizio & Di Guardo 2001)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 666.6* (29.8°C, static method-pressure gauge, Kahlbaum 1898)
 666.6* (27.8°C, summary of literature data, Stull 1947)
 $\log(P/\text{mmHg}) = 7.25422 - 1688.4/(230 + t/^\circ\text{C})$ (Antoine eq., Dreisbach & Martin 1949)
 6287* (71.86°C, ebulliometry, measured range 71.86–158.06°C, Dreisbach & Shrader 1949)
 3066* (56.07°C, temp range 56.07–154.24°C, Dreyer et al. 1954)
 558 (calculated by formula, Dreisbach 1955)
 $\log(P/\text{mmHg}) = 6.91444 - 1474.06/(209.4 + t/^\circ\text{C})$; temp range 60–190°C (Antoine eq. for liquid state, Dreisbach 1955)
 997 (35°C, gas saturation-gravitational or UV, Hine et al. 1963)
 697 (ebulliometry, extrapolated-Antoine eq., measured range 49–131°C, Hammaker & Kerlinger 1969)
 $\log(P/\text{mmHg}) = 7.7807 - 2105.4/(T/\text{K})$; temp range 49–131°C (ebulliometry, Hammaker & Kerlinger 1969)

 $\log(P/\text{mmHg}) = [-0.2185 \times 10157.7/(T/\text{K})] + 8.07500$; temp range –26 to –15°C (Antoine eq., Weast 1972–73)
 552 (extrapolated-Antoine eq., Boublik et al. 1973)
 $\log(P/\text{mmHg}) = 5.86064 - 1438.817/(205.441 + t/^\circ\text{C})$; temp range 56.07–154°C (Antoine eq. from reported exptl. data, Boublik et al. 1973)
 553, 555 (extrapolated-Antoine eq., Boublik et al. 1984)
 $\log(P/\text{kPa}) = 5.99238 - 1443.265/(205.94 + t/^\circ\text{C})$; temp range 56.07–154°C (Antoine eq. from reported exptl. data of Dreyer et al. 1954/55, Boublik et al. 1984)
 $\log(P/\text{kPa}) = 5.98225 - 1433.858/(204.562 + t/^\circ\text{C})$; (Antoine eq. from reported exptl. data of Dreisbach & Shrader 1949, Boublik et al. 1984)
 $\log(P/\text{mmHg}) = 6.86064 - 1438.817/(205.441 + t/^\circ\text{C})$; temp range 56–154°C (Antoine eq., Dean 1985, 1992)
 557.6 (Riddick et al. 1986)
 $\log(P/\text{kPa}) = 6.37912 - 1688.4/(230 + t/^\circ\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log(P_L/\text{kPa}) = 6.03934 - 1474.03/(-63.75 + T/\text{K})$; temp range 333–463 K (Antoine eq.-I, Stephenson & Malanowski 1987)
 $\log(P_L/\text{kPa}) = 6.40524 - 1776.58/(-25.639 + T/\text{K})$; temp range 429–633 K (Antoine eq.-II, Stephenson & Malanowski 1987)
 $\log(P/\text{mmHg}) = -9.4583 - 2.5177 \times 10^3/(T/\text{K}) + 9.2584 \cdot \log(T/\text{K}) - 1.9386 \times 10^{-2} \cdot (T/\text{K}) + 9.6324 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 242–670 K (vapor pressure eq., Yaw et al. 1994)
 $\log(P/\text{kPa}) = 5.99238 - 1443.265/(T/\text{K})$ (database of CDATA 1991, Hovorka & Dohnal 1997)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations):

- 211 (1/K_{AW} or C_w/C_A, Hine & Mookerjee 1975;)
 247 (gas stripping-GC, Mackay & Shiu 1981, 1990)
 210 (recommended, Mackay & Shiu 1981)
 211 (computer value, Yaws et al. 1991)
 256, 332, 579 (30.0, 35, 44.8°C, EPICS-GC, Hansen et al. 1993)
 $\ln[H/(\text{kPa} \cdot \text{m}^3/\text{mol})] = -5341/(T/\text{K}) + 16.0$; temp range 30–45°C (EPICS measurements, Hansen et al. 1993)
 92.0, 167, 280, 430, 610 (10, 20, 30, 40, 50°C, equilibrium air stripping-GC, Hovorka & Dohnal 1997)
 139 (20°C, selected from literature of experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 6.375 - 2233/(T/\text{K})$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, log K_{OW} (at 25°C or as indicated):

- 2.99 (shake flask-UV, Fujita et al. 1964; Hansch et al. 1968; Leo et al. 1971; Hansch & Leo 1979)
 3.03 (calculated-fragment const.; Rekker 1977)
 3.16 (HPLC-k' correlation, McDuffie 1981)
 2.98 (generator column-HPLC, Wasik et al. 1983)
 3.02 (HPLC-RT correlation, D'Amboise & Hanai 1982)
 3.01 (shake flask-GC, Watarai et al. 1982)
 3.02 (HPLC-RT correlation, Eadsforth & Moser 1983)

- 3.01 (HPLC-RT correlation, Garst & Wilson 1984)
- 3.15 (HPLC correlation, Eadsforth 1986)
- 2.99 (recommended, Sangster 1989, 1993)
- 2.75, 2.94 (shake flask-UV/VIS spec. 25, 60°C; Kramer & Henze 1990)
- 2.99 (recommended, Hansch et al. 1995)
- 3.29, 3.25, 3.14, 3.12 (5, 15, 25, 35°C, estimated- RP-HPLC- k' correlation, Finizio & Di Guardo 2001)

Bioconcentration Factor, log BCF:

- 3.18 (activated sludge, Freitag et al. 1984)
- 2.28 (algae, Freitag et al. 1984)
- 1.68 (fish, Freitag et al. 1984)
- 1.68, 2.28, 3.18 (fish, algae, activated sludge, Halfon & Reggiani 1986)
- 1.70 (Freitag et al. 1985)
- 1.899, 1.928 (calculated- K_{OW} , calculated- MCI χ , Lu et al. 1999)

Sorption Partition Coefficient, log K_{OC} :

- 2.18 (soil, selected lit., Kenaga & Goring 1980)
- 2.18 (calculated-S. Kenaga 1980)
- 2.80 (calculated-MCI χ , Koch 1983)
- 2.56 (calculated-MCI. Sabjic 1984)
- 2.65 (calculated-MCI, Bahnick & Doucette 1988)
- 2.65 (HPLC-RT correlation, cyanopropy column, Hodson & Williams 1988)
- 3.37 (activated carbon, Blum et al. 1994)
- 2.49 (soil, calculated-MCI χ , Sabljic et al. 1995)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}^* = 7.3 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp., measured range 245–362 K (flash photolysis-resonance fluorescence, Witte et al. 1986)

$k_{OH}(\text{calc}) = 1.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs}) = 0.71 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (9.15 \pm 0.97) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 234–438 K ((flash photolysis-resonance fluorescence, Wallington et al. 1987)

$k_{OH} = 7.70 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, independent of temperature over the range 234–362 K (Atkinson 1989)

$k_{OH}(\text{calc}) = 0.58 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)

Hydrolysis:

Biodegradation: relative rate from activated sludge approximately of 34.8% CO_2 (Freitag et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

TABLE 6.1.4.1.1

Reported aqueous solubilities of bromobenzene at various temperatures

$$S(\text{wt}\%) = 1.09002 \times 10^{-2} + 4.43314 \times 10^{-4} \cdot (t/^{\circ}\text{C}) + 1.20007 \times 10^{-5} \cdot (t/^{\circ}\text{C})^2 - 1.33342 \times 10^{-7} \cdot (t/^{\circ}\text{C})^3 \quad (1)$$

$$S(\text{g/kg}) = 1.8293 - 1.35675 \times 10^{-2} \cdot (T/\text{K}) + 2.99322 \times 10^{-5} \cdot (T/\text{K})^2 \quad (2)$$

FIGURE 6.1.4.1.2 Logarithm of vapor pressure versus reciprocal temperature for bromobenzene.

6.1.4.2 1,2-Dibromobenzene

Common Name: 1,2-Dibromobenzene

Synonym: *o*-dibromobenzene

Chemical Name: 1,2-Dibromobenzene

CAS Registry No: 583-53-9

Molecular Formula: $C_6H_4Br_2$

Molecular Weight: 235.904

Melting Point ($^{\circ}C$):

7.1 (Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

225 (Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.98429, 1.9767 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach 1955)

1.9843 ($20^{\circ}C$, Weast 1982–83; Lide 2003)

Molar Volume (cm^3/mol):

120.2 (calculated-density, Stephenson & Malanowski 1987)

142.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

59.31, 42.594 ($25^{\circ}C$, bp, Dreisbach 1961)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

7.279 (Dreisbach 1955)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

74.55 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

74.8 (recommended-tentative, IUPAC Solubility Data Series, Horvath & Getzen 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

$\log(P/mmHg) = 7.44451 - 2050.3/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

25.7 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 7.10265 - 1825.77/(207.0 + t/^{\circ}C)$; temp range 115 – $295^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

26.0 (interpolated-Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 7.50128 - 2093.1/(t/^{\circ}C + 230)$; temp range 28 – $117^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P/mmHg) = 7.10265 - 1825.77/(t/^{\circ}C + 207)$; temp range 117 – $300^{\circ}C$ (Antoine eq., Dean 1985, 1992)

22.80 (extrapolated, Antoine eq., Stephenson & Malanowski 1987)

$\log(P/kPa) = 6.22755 - 1825.77/(T/K - 66.15)$; temp range 388 – $588\ K$ (Antoine eq., liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.64 (shake flask, Hansch & Leo 1979; Hansch et al. 1995)

3.68 (HPLC-RT correlation, Garst & Wilson 1984)

3.64 (recommended, Sangster 1993)

3.64 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

2.70; 3.50 (*Pimephales promelas*; *Poecilia reticulata*, under static and semi-static conditions, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

6.1.4.3 1,3-Dibromobenzene

Common Name: 1,3-Dibromobenzene

Synonym: *m*-dibromobenzene

Chemical Name: 1,3-Dibromobenzene

CAS Registry No: 108-36-1

Molecular Formula: $C_6H_4Br_2$

Molecular Weight: 235.904

Melting Point ($^{\circ}C$):

−7.0 (Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

218 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.9523 ($20^{\circ}C$, Weast 1982–83; Lide 2003)

Molar Volume (cm^3/mol):

120.8 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

142.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

67.4 ($30^{\circ}C$, shake flask-UV, Hine et al. 1963)

98.45 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

64.0 (recommended-tentative, IUPAC Solubility Data Series, Horvath & Getzen 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

57.06 ($35^{\circ}C$, gas saturation-gravitational or UV spectrophotometry, Hine et al. 1963)

22.78 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P/kPa) = 5.971 - 1603.4/(T/K - 87.55)$; temp range 417–500 K (Antoine eq., liquid, Stephenson & Malanowski 1987)

157, 61.05 (calculated- ΔS_v , mp and bp, Antoine eq., Yalkowsky & Mishra 1990, Mishra & Yalkowsky 1991)

$\log(P/mmHg) = 59.2974 - 4.6960 \times 10^3/(T/K) - 18.444 \cdot \log(T/K) + 6.7598 \times 10^{-3} \cdot (T/K) - 2.5567 \times 10^{-13} \cdot (T/K)^2$; temp range 226–761 K (vapor pressure eq., Yaw et al. 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.75 (shake flask, Hansch & Leo 1979; Hansch et al. 1995)

3.79 (shake flask-GC, Watarai et al. 1982)

3.78 (Oliver & Niimi 1984)

3.74 (HPLC- k' correlation, Haky & Yeung 1984)

3.75 (recommended, Sangster 1993)

3.75 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.78 (mean value, rainbow trout, Oliver & Niimi 1984)

2.82 (rainbow trout, Oliver 1987)

2.82 (*Oncorhynchus mykiss*, under flow-through conditions, quoted, Devillers et al. 1996)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: pseudo-first order reaction rate constant for direct photolysis $k = 0.009 \text{ min}^{-1}$ with $t_{1/2} = 76.8 \text{ min.}$ in dilute aqueous solution (Peijnenburg et al. 1992).

Half-Lives in the Environment:

Air:

Surface water: pseudo-first order reaction rate constant for direct photolysis $k = 0.009 \text{ min}^{-1}$ with $t_{1/2} = 76.8 \text{ min.}$ in dilute aqueous solution (Peijnenburg et al. 1992).

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 3 \text{ d}$ (guppy, Niimi 1987)

6.1.4.4 1,4-Dibromobenzene

Common Name: 1,4-Dibromobenzene

Synonym: *p*-dibromobenzene

Chemical Name: 1,4-Dibromobenzene

CAS Registry No: 106-37-6

Molecular Formula: C₆H₄Br₂

Molecular Weight: 235.904

Melting Point (°C):

87.43 (Lide 2003)

Boiling Point (°C):

218.5 (Lide 2003)

Density (g/cm³ at 20°C):

1.5742 (20°C, Weast 1982–83)

Molar Volume (cm³/mol):

121 (calculated-density, Lande & Banerjee 1981)

142.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

4.837 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.244 (mp at 87.43°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

20.0 (shake flask-UV, Andrews & Keefer 1950)

26.42 (35°C, shake flask-UV spectrophotometry, Hine et al. 1963)

20.08 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

20.0 (recommended-tentative, IUPAC Solubility Data Series, Horvath & Getzen 1985)

17.0* (shake flask-HPLC, measured range 10–35°C, Kuramochi et al. 2004)

ln [S/(mol/L)] = −3151.3.7/(T/K) + 1.06; temp range 10–35°C (shake flask-HPLC, Kuramochi et al. 2004)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (61°C, summary of literature data, Stull 1947)

log (P/mmHg) = 7.44830 − 2057.2/(230 + t/°C) (Antoine eq., Dreisbach & Martin 1949)

9.33* (25.8°C, manometer, temp range 25.8–80.5°C, Walsh & Smith 1961)

log (P/mmHg) = 11.592 − 3826.2/(T/K); temp range 25.8–80.5°C (manometer, Walsh & Smith 1961)

17.87 (35°C, gas saturation-gravitational or UV spectrophotometry, Hine et al. 1963)

log (P/mmHg) = [−0.2185 × 13047.8/(T/K)] + 8.769771; temp range 61–218.6°C (Antoine eq., Weast 1972–73)

3.96* (18.13°C, capacitance manometer; De Kruif et al. 1981)

7.65 (interpolated, Antoine eq., Stephenson & Malanowski 1987)

log P/kPa = 10.717 − 3826.2/(T/K); temp range 298–354 K (Antoine eq., solid, Stephenson & Malanowski 1987)

log P/kPa = 6.5732 − 2047.2/(T/K − 43.15); temp range 373–493 K (Antoine eq., liquid, Stephenson & Malanowski 1987)

35.95, 53.18 (calculated-bp, Antoine eq., Yalkowsky & Mishra 1990)

Henry's Law Constant (Pa·m³/mol at 25°C):

106 (derived from γ_w, infinite dilution activity coefficient, Kuramochi et al. 2004)

Octanol/Water Partition Coefficient, log K_{ow} :

3.75	(shake flask, Hansch & Leo 1979)
4.07	(calculated-fragment const., Yalkowsky et al. 1979; Valvani & Yalkowsky 1980)
4.13	(calculated-fragment const., Yalkowsky et al. 1983)
3.79	(shake flask-GC, Watarai et al. 1982)
3.89	(Gobas et al. 1989)
3.79	(recommended, Sangster 1993)
3.79	(recommended, Hansch et al. 1995)
3.62	(GC-RT correlation, Kuramochi et al. 2004)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C:

5.21	(calculated- S_{oct} and vapor pressure, Abraham et al. 2001)
------	---

Bioconcentration Factor, log BCF:

3.15	(guppy, lipid-weight based, Gobas et al. 1989)
1.96	(<i>Poecilia reticulata</i> , under flow-through conditions, Devillers et al. 1996)
2.70; 3.40	(<i>Poecilia reticulata</i> ; <i>Pimephales promelas</i> , under static and semi-static conditions, Devillers et al. 1996)
3.15	(Gobas et al. 1989)

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:
 log $k_1 = 2.11 \text{ d}^{-1}$; log $k_2 = 0.15 \text{ d}^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

TABLE 6.1.4.4.1

Reported aqueous solubilities and vapor pressures of 1,4-dibromobenzene at various temperatures and the coefficients for the vapor pressure equations

log P = A – B/(T/K)		(1)	ln P = A – B/(T/K)		(1a)		
log (P/mmHg) = A – B/(C + t/°C)		(2)	ln P = A – B/(C + t/°C)		(2a)		
log (P/Pa) = A – B/(C + T/K)		(3)					
log (P/mmHg) = A – B/(T/K) – C·log (T/K)		(4)

FIGURE 6.1.4.4.1 Logarithm of mole fraction solubility and vapor pressure versus reciprocal temperature for 1,4-dibromobenzene.

6.1.4.5 1,2,3-Tribromobenzene

Common Name: 1,2,3-Tribromobenzene

Synonym:

Chemical Name: 1,2,3-tribromobenzene

CAS Registry No: 608-21-9

Molecular Formula: $C_6H_3Br_3$

Molecular Weight: 314.800

Melting Point ($^{\circ}C$):

87.8 (Weast 1982–83)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

2.658 (Weast 1982–83, Horvath 1982)

Molar Volume (cm^3/mol):

137.7 (Ruelle & Kesselring 1997)

118 (calculated-density, Wang et al. 1992)

165.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.242 (mp at $87.8^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.94 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.98; 4.25 (quoted exptl value; calculated-molar volume, Wang et al. 1992)

4.57; 4.42 (predicted; calculated-atom typing scheme, Inel & Iseri 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 3\ d$ in guppy (for tribromobenzenes, Niimi 1986).

6.1.4.6 1,2,4-Tribromobenzene

Common Name: 1,2,4-Tribromobenzene

Synonym:

Chemical Name: 1,2,4-tribromobenzene

CAS Registry No: 615-54-3

Molecular Formula: $C_6H_3Br_3$

Molecular Weight: 314.800

Melting Point ($^{\circ}C$):

44.5 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

275 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

137.7 (Ruelle & Kesselring 1997)

165.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.644 (mp at $44.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

9.96 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

10.1 (recommended-tentative, IUPAC Solubility Data Series, Hovrath & Getzen 1985)

3.67, 7.21, 11.0 (10, 25, $35^{\circ}C$, generator column-HPLC, Kuramochi et al. 2004)

$\ln [S/(mol/L)] = -3836.9/(T/K) + 2.19$; temp range 10 – $35^{\circ}C$ (generator column-HPLC, Kuramochi et al. 2004)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

31.9 (derived from γ_w , infinite dilution activity coefficient, Kuramochi et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.51 (shake flask-GC, Watarai et al. 1982)

4.54 (Oliver & Niimi 1984)

4.32 (GC-RT correlation, Kuramochi et al. 2004)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.63 (rainbow trout, Oliver 1984, Oliver & Niimi 1984, Oliver 1987)

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 3$ d in guppy (for tribromobenzenes, Niimi 1987)

6.1.4.7 1,3,5-Tribromobenzene

Common Name: 1,3,5-Tribromobenzene

Synonym:

Chemical Name: 1,3,5-tribromobenzene

CAS Registry No: 626-39-1

Molecular Formula: $C_6H_3Br_3$

Molecular Weight: 314.800

Melting Point ($^{\circ}C$):

122.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

271 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

137.7 (Ruelle & Kesselring 1997)

165.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.11 (mp at $122.8^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

200 (shake flask-residue volume method, Booth & Everson 1948)

0.04 (Stephen & Stephen 1963)

0.787 (shake flask-UV, Yalkowsky et al. 1979)

0.789 (recommended-tentative, IUPAC Solubility Data Series, Hovrath & Getzen 1985)

Vapor Pressure (Pa at $25^{\circ}C$):

5.187 (GC-RT correlation, Watanabe & Tatsukawa 1989)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.51 (shake flask-GC, Watarai et al. 1982)

5.07 (calculated-fragment const., Yalkowsky et al. 1983)

4.60, 4.63 (HPLC-RT correlation, Garst 1984)

5.26 (HPLC-RT correlation, Gobas et al. 1989)

5.18 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

4.51 (recommended, Sangster 1993)

4.51 (selected, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.70 (rainbow trout, Oliver & Niimi 1984, Oliver 1987)

3.26–4.08 mean 3.97; 3.53–4.20 mean 4.08 (rainbow trout, wet wt. basis, $15^{\circ}C$, steady-state BCF on 7- to 96-d laboratory study in two tanks of different water concn, Oliver & Niimi 1985)

4.42 (guppy, lipid-weight based, Gobas et al. 1989)

3.23; 3.70, 3.97, 4.08 (*Poecilia reticulata*; *Oncorhynchus mykiss*, quoted values, Devillers et al. 1996)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: pseudo-first order reaction rate constant in dilute aqueous solution $k = 0.005 \text{ min}^{-1}$ with $t_{1/2} = 140.5 \text{ min}$. (Peijeneburg et al. 1992).

Oxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$\log k_1 = 2.85 \text{ d}^{-1}$; $\log k_2 = -0.38 \text{ d}^{-1}$ (guppy, Gobas et al. 1989)

Half-Lives in the Environment:

Air:

Surface water: pseudo-first order reaction rate constant for direct photolysis in dilute aqueous solution $k = 0.005 \text{ min}^{-1}$ with $t_{1/2} = 140.5 \text{ min}$. (Peijeneburg et al. 1992).

Groundwater:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 3 \text{ d}$ (guppy, for tribromobenzenes, Niimi 1987)

6.1.4.8 1,2,4,5-Tetrabromobenzene

Common Name: 1,2,4,5-Tetrabromobenzene

Synonym:

Chemical Name: 1,2,4,5-tetrabromobenzene

CAS Registry No: 636-28-2

Molecular Formula: $C_6H_2Br_4$

Molecular Weight: 393.696

Melting Point ($^{\circ}C$):

182 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

3.072 (Weast 1982–83)

Molar Volume (cm^3/mol):

128.2 (calculated-density, Wang et al. 1992)

153.8 (Ruelle & Kesselring 1997)

189.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0288 (mp at $182^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0433 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

0.0434 (recommended-tentative, IUPAC Solubility Data Series, Hovrath & Getzen 1985)

0.044 (shake flask-GC, Kim & Saleh 1990)

0.0182, 0.0435, 0.0778 (10, 25, $35^{\circ}C$, generator column-HPLC, Kuramochi et al. 2004)

$\ln [S/(mol/L)] = -4967.5/(T/K) + 0.681$; temp range 10 – $35^{\circ}C$ (generator column-HPLC, Kuramochi et al. 2004)

Vapor Pressure (Pa at $25^{\circ}C$):

0.157 (GC-RT correlation, Watanabe & Tatsukawa 1989)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

376 (derived from γ_w , infinite dilution activity coefficient, Kuramochi et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.13 (shake flask-GC, Watarai et al. 1982)

5.25 (HPLC-RT correlation, Garst 1984)

5.56 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.13 (recommended, Sangster 1993)

5.13 (recommended, Hansch et al. 1995)

5.00 (GC-RT correlation, Kuramochi et al. 2004)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

3.80 (rainbow trout, Banerjee et al. 1980)

2.94–3.68 mean 3.57; 3.40–3.91 mean 3.81 (rainbow trout, wet wt. basis, $15^{\circ}C$, steady-state BCF on 7- to 96-d laboratory study in two tanks of different water concn, Oliver & Niimi 1985)

3.80 (Nendza 1993; quoted, Lu et al. 1999)

3.57 (*Oncorhynchus mykiss*, flow through conditions, Devillers et al. 1996)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 4$ d in guppy (for tetrabromobenzenes, Niimi 1987)

6.1.4.9 Hexabromobenzene

Common Name: Hexabromobenzene

Synonym:

Chemical Name: hexabromobenzene

CAS Registry No: 87-82-1

Molecular Formula: C_6Br_6

Molecular Weight: 551.488

Melting Point ($^{\circ}C$):

327 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

186 (Ruelle & Kesselring 1997)

235.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

85 (Tittlemier et al. 2002)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 0.0011 (mp at $327^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and the reported temperature dependence equations):

0.00016 ($22^{\circ}C$, generator column-GC, Opperhuizen 1986)

0.0030 (generator column-GC/ECD, Tittlemier et al. 2002)

0.0000472, 0.00011, 0.000232 (10, 25, $35^{\circ}C$, generator column-HPLC, Kuramochi et al. 2004)

$\ln [S/(mol/L)] = -5484.7/(T/K) - 3.85$; temp range 10 – $35^{\circ}C$ (generator column-HPLC, Kuramochi et al. 2004)

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equations):

3.133×10^{-4} (estimated, Lyman et al. 1982)

3.845×10^{-4} (GC-RT correlation, Watanabe & Tatsukawa 1989)

7.50×10^{-4} (supercooled liquid P_L , GC-RT correlation, Tittlemier et al. 2002)

$\log (P_L/Pa) = -4454/(T/K) + 11.82$ (Claiius-Clapeyron eq. from GC-RT correlation, Tittlemier et al. 2002)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.284 (calculated, Meylan & Howard 1991)

0.14 (calculated- P_L/C_L , Tittlemier et al. 2002)

10.8 (derived from γ_w , infinite dilution activity coefficient, Kuramochi et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.15, 6.07 (HPLC-RT correlation, Garst 1984)

7.80 (HPLC-RT correlation, Opperhuizen 1986)

> 6.0 (estimated, Gobas et al. 1987)

7.06 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

6.07 (recommended, Sangster 1993)

6.07 (Hansch et al. 1995)

6.07 (GC-RT correlation, Kuramochi et al. 2004)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

2.95–3.08 mean 3.04 (rainbow trout, wet wt., 15°C, steady-state BCF on 21- to 96-d laboratory study, Oliver & Niimi 1985)

1.0 (Kawasaki 1980)

5.0 (Nendza 1993)

4.892, 4.681 (calculated-MCI, calculated- K_{OW} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

4.45, 4.68 (estimated-solubility, Lyman et al. 1982; quoted, K_{OW} , Howard 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated volatilization $t_{1/2} = 3.3$ d from a model river is 3.3 d, $t_{1/2} = 114$ months from a model pond with adsorptive processes (Howard 1997)

Photolysis: not expected to occur (Howard 1997)

Oxidation: not expected to occur (Howard 1997)

Hydrolysis: not expected to occur (Howard 1997)

Half-Lives in the Environment:

Air:

Surface water: estimated volatilization $t_{1/2} = 3.3$ d from a model river, $t_{1/2} = 114$ months from a model pond with adsorptive processes (Howard 1997)

Groundwater:

Sediment:

Soil:

Biota:

6.1.4.10 2-Bromotoluene

Common Name: 2-Bromotoluene

Synonym: *o*-bromotoluene, 1-bromo-2-methylbenzene

Chemical Name: 2-bromotoluene

CAS Registry No: 95-46-5

Molecular Formula: C₇H₇Br

Molecular Weight: 171.035

Melting Point (°C):

– 27.8 (Weast 1982–82; Lide 2003)

Boiling Point (°C):

181.7 (Dreisbach 1959; Weast 1982–83; Lide 2003)

Density (g/cm³ at 20°C):

1.42322, 1.41774 (20°C, 25°C, Dreisbach 1959)

1.4232 (Weast 1982–83; Lide 2003)

Molar Volume (cm³/mol):

120.2 (20°C, calculated-density, Stephenson & Malanowski 1987; Ruelle & Kesselring 1997)

141.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

49.264, 38.995 (25°C, bp, Dreisbach 1955)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

2.423 (Dreisbach 1955)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

51.3 (estimated, Howard 1997)

1007; 105 (quoted, calculated-molar volume and mp, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

186 (interpolated-Antoine eq., Stuckey & Saylor 1940)

$\log P/\text{mmHg} = 7.50879 - 1913.46/(T/K - 38.34)$; temp range 4–75°C (Antoine eq. based on exptl. data, Hg manometer, Stuckey & Saylor 1940)

133.3* (24.4, summary of lit. data, Stull 1947)

181 (calculated by formula., Dreisbach 1955)

$\log (P/\text{mmHg}) = 6.90847 - 1549.39/(C + t/^\circ\text{C})$; temp range 80–245°C, (Antoine eq. for liquid state, Dreisbach 1955)

$\log (P/\text{mmHg}) = [-0.2185 \times 11365.0/(T/K)] + 8.396578$; temp range 24.4–181.8°C (Antoine eq., Weast 1972–73)

$\log (P_L/\text{kPa}) = 6.03337 - 1549.39/(T/K - 70.15)$; temp range 353–518 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa·m³/mol at 25°C):

242 (estimated-group contribution method, Meylan & Howard 1991)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.92 (Hansch & Leo 1979, Hansch et al. 1995)

3.61 (HPLC-*k'* correlation, Hanai et al. 1981)

3.43 (estimated, Howard 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, log BCF or log K_B :

2.38 (estimated- K_{OW} , Howard 1997)

Sorption Partition Coefficient, log K_{OC} :

2.96 (estimated, Howard 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 1.7$ h from a model river 1-m deep and $t_{1/2} = 14.9$ d from a pond (Howard 1997).

Photolysis:

Oxidation: atmospheric $t_{1/2} \sim 6.2$ d for reaction with hydroxyl radicals in air (Howard 1997).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric $t_{1/2} \sim 6.2$ d for reaction with OH radicals in air (Howard 1997).

Surface water: volatilization $t_{1/2} = 1.7$ h from a model river 1-m deep flowing 1 m/s with a wind speed of 5 m/s and $t_{1/2} = 14.9$ d from a model pond with adsorption from water column (Howard 1997).

6.1.4.11 3-Bromotoluene

Common Name: 3-Bromotoluene

Synonym: *m*-bromotoluene

Chemical Name: 3-bromotoluene

CAS Registry No: 591-17-3

Molecular Formula: C_7H_7Br

Molecular Weight: 171.035

Melting Point ($^{\circ}C$):

−39.8 (Lide 2003)

Boiling Point ($^{\circ}C$):

183.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.4099 (Lide 2003)

Molar Volume (cm^3/mol):

121.3 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

141.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

51.3 (estimated, Howard 1997)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($14.8^{\circ}C$, summary of lit. data, Stull 1947)

$\log P/mmHg = 7.75409 - 2049.14/(T/K - 31.44)$; temp range $4-75^{\circ}C$ (Antoine eq. based on exptl. data, Hg manometer, Stuckey & Saylor 1940)

$\log (P/mmHg) = [-0.2185 \times 10537.1/(T/K)] + 7.886560$; temp range $14.8-183.7^{\circ}C$ (Antoine eq., Weast 1972-73)

145 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/kPa) = 6.86228 - 2085.49/(T/K - 27.333)$; temp range: 287-457 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

445 (estimated-P/C, Howard 1997)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.43 (estimated, Howard 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

2.38 (estimated- K_{ow} , Howard 1997)

Sorption Partition Coefficient, $\log K_{OC}$:

2.96 (estimated, Howard 1997)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 1.5$ h and 14.9 d from a model river 1-m deep and $t_{1/2} = 14.9$ d from a pond (Howard 1997).

Photolysis:

Oxidation: atmospheric $t_{1/2} \sim 3$ d for reaction with hydroxyl radical in air (Howard 1997).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric $t_{1/2} \sim 3$ d half-life for reaction with hydroxyl radical in air (Howard 1997).

Surface water: volatilization $t_{1/2} = 1.5$ h from a model river 1 m deep flowing 1 m/s with a wind speed of 5 m/s) and $t_{1/2} = 14.9$ d in a model pond with adsorption, from water column (Howard 1997).

6.1.4.12 4-Bromotoluene

Common Name: 4-Bromotoluene

Synonym: *p*-bromotoluene, 4-bromo-1-methylbenzene

Chemical Name: *p*-bromotoluene

CAS Registry No: 106-38-7

Molecular Formula: C₇H₇Br

Molecular Weight: 171.042

Melting Point (°C):

28.5 (Lide 2003)

Boiling Point (°C):

184.3 (Lide 2003)

Density (g/cm³ at 25°C):

1.39953 (Dreisbach 1955)

Molar Volume (cm³/mol):

122.5 (Ruelle & Kesselring 1997)

141.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

49.74, 39.98 (25°C, bp, Dreisbach 1955)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

14.82 (Dreisbach 1955)

3.5684 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

110 (Hine & Mookerjee 1975)

110; 81.9 (quoted; calculated-molar volume and mp, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

133.3* (10.3°C, summary of lit. data, Stull 1947)

153.2 (calculated by formula., Dreisbach 1955)

log (P/mmHg) = 7.00762 – 1612.35/(206.36 + t/°C); temp range 85–250°C (Antoine eq. for liquid state, Dreisbach 1955)

log (P/mmHg) = 7.00762 – 1612.35/(t/°C + 206.36); temp range 85–280°C (Antoine eq., Dean 1985, 1992)

log (P/kPa) = 6.13252 – 1612.35/(T/K – 66.79); temp range 358–523 K (Antoine eq., Stephenson & Malanowski 1987)

log (P/mmHg) = 12.8209 – 2.6568 × 10³/(T/K) – 1.4314·log (T/K) – 8.9677 × 10⁻⁴·(T/K) + 3.9733 × 10⁻⁷·(T/K)², temp range 300–699 K (Yaws 1994)

Henry's Law Constant (Pa·m³/mol at 25°C):

23.82 (calculated-P/C, Howard 1997)

Octanol/Water Partition Coefficient, log K_{ow}:

3.42 (quoted, Howard 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

2.54 (calculated- K_{OW} , Howard 1997)

Sorption Partition Coefficient, $\log K_{OC}$:

3.10–3.27 (estimated, Howard 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $t_{1/2} \sim 9.4$ d for reaction with OH radical in the atmosphere (Howard 1997).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: atmospheric $t_{1/2} \sim 9.4$ d for reaction with OH radical (Howard 1997).

Surface water: volatilization $t_{1/2} = 4.3$ h from a model river 1 m deep and $t_{1/2} = 14.9$ d from an environmental pond (Howard 1997).

6.1.5 IODOBENZENES

6.1.5.1 Iodobenzene

Common Name: Iodobenzene

Synonym: phenyl iodide

Chemical Name: iodobenzene

CAS Registry No: 591-50-4

Molecular Formula: C_6H_5I

Molecular Weight: 204.008

Melting Point ($^{\circ}C$):

−31.3 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

188.4 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.8308 (Weast 1982–83; Lide 2003)

1.8308, 1.8229($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

111.4 ($20^{\circ}C$, calculated-density, Stephenson & Malanowski 1987; Wang et al. 1992)

129.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

40.794 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

340 ($30^{\circ}C$, Gross et al. 1933)

180 (shake flask-UV spectrophotometry, Andrews & Keefer 1950)

228* ($25.1^{\circ}C$, shake flask-spectrophotometry, measured range 10 – $35^{\circ}C$, Vesala 1973)

229 (shake flask-UV spectrophotometry, Vesala 1974)

158 (Deno & Berkheimer 1960)

95* (shake flask-GC, measured range 5 – $45.5^{\circ}C$, Nelson & Smit 1978)

267.6* (summary of literature data, temp range 25 – $50^{\circ}C$, Horvath 1982)

201 (Miller et al. 1985)

226* (recommended, temp range 10 – $45^{\circ}C$, IUPAC Solubility Data Series, Horvath & Getzen 1985)

$S/(g/kg) = 0.59293 - 4.8616 \times 10^{-3} \cdot (T/K) + 1.21754 \times 10^{-5} \cdot (T/K)^2$; temp range 283 – 318 K (regression of literature data, IUPAC Solubility Data Series, Horvath & Getzen 1985)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

213* ($29.3^{\circ}C$, Ramsay-Young method, measured range 29.3 – $100.35^{\circ}C$, Young 1889)

133.3*, 666.6 (24.1 , $50.6^{\circ}C$, summary of lit. data, temp range 24.1 – $188.6^{\circ}C$, Stull 1947)

134.5 (calculated by formula, Dreisbach 1955)

$\log(P/mmHg) = 6.89506 - 1562.87/(201.0 + t/^{\circ}C)$; temp range: 85 – $270^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

132.0 (Antoine eq., Boublik et al. 1973)

$\log(P/mmHg) = 7.01187 - 1640.124/(208.765 + t/^{\circ}C)$; temp range 29.3 – $188.2^{\circ}C$ (Antoine eq. from reported exptl. data of Young 1889, Boublik et al. 1973)

134 (extrapolated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.15935 - 1656.226/(210.496 + t/^{\circ}\text{C})$; temp range 29.3–188.2°C (Antoine eq. from reported exptl. data of Young 1889, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 7.0119 - 1640.1/(208.8 + t/^{\circ}\text{C})$; temp range 20–188°C (Antoine eq., Dean 1985, 1992)

134.5 (Riddick et al. 1986)

133 (interpolated-Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.01996 - 1562.87/(-72.15 + T/\text{K})$; temp range 358–543 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.46493 - 1867.69/(-20.202 + T/\text{K})$; temp range 462–679 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.36129 - 1765.99/(-54.15 + T/\text{K})$; temp range 273–358 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 32.7342 - 3.5824 \times 10^3/(T/\text{K}) - 8.4197 \cdot \log (T/\text{K}) + 2.0073 \times 10^{-10} \cdot (T/\text{K}) + 1.591 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 242–721 K (Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

130 (recommended, Mackay & Shiu 1981)

134 (computer value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

3.25, 3.32 (quoted, calculated-fragment const., Rekker 1977)

3.25 (Hansch & Leo 1979)

3.28 (generator column-HPLC, Wasik et al. 1983)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

3.8064 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.706 (mp at $40.4^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

9.67 (shake flask-UV, Andrews & Keefer 1950)

8.88 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.64 (calculated-fragment const., Yalkowsky et al. 1979; Valvani & Yalkowsky 1980; Yalkowsky et al. 1983)

4.39 (calculated, Müller & Klein 1992)

4.70 (calculated-molar volume correlation, Wang et al. 1992)

5.25; 4.56 (predicted; calculated-atom typing scheme, Inel & Iseri 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

6.1.5.4 1,4-Diiodobenzene

Common Name: 1,4-Diiodobenzene

Synonym: *p*-diiodobenzene

Chemical Name: 1,4-Diiodobenzene

CAS Registry No: 624-38-4

Molecular Formula: $C_6H_4I_2$

Molecular Weight: 329.905

Melting Point ($^{\circ}C$):

131.5 (Horvath 1982; Lide 2003)

Boiling Point ($^{\circ}C$):

285 (sublimation, Weast 1982–83, Horvath 1982; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

162.6 (calculated-Le Bas method at normal boiling point)

134.6 (Ruelle & Kesselring 1997)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.3342 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0902 (mp at $131.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

4.62 (shake flask-UV, Andrews & Keefer 1950)

1.855 (shake flask-UV, Yalkowsky et al. 1979, Yalkowsky & Valvani 1980)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.545 (extrapolated Antoine eq., Stephenson & Malanowski 1987)

$\log(P_s/kPa) = 8.29504 - 33311.326/(T/K)$; temp range 372–401 K (Antoine eq.-I, solid, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.8859 - 2747.88/(T/K)$; temp range 402–560 K (Antoine eq.-II, liquid, Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.64 (calculated-fragment const., Yalkowsky et al. 1979; Valvani & Yalkowsky 1980; Yalkowsky et al. 1983; quoted, Wang et al. 1992)

4.39 (calculated, Müller & Klein 1992)

4.11 (shake flask, recommended, Hansch et al. 1995)

4.64, 5.24; 4.56 (quoted exptl., predicted; calculated-atom typing scheme, Inel & Iseri 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

6.1.5.5 1,2,3-Triiodobenzene

Common Name: 1,2,3-Triiodobenzene

Synonym:

Chemical Name: 1,2,3-Triiodobenzene

CAS Registry No: 608-29-7

Molecular Formula: $C_6H_3I_3$

Molecular Weight: 455.801

Melting Point ($^{\circ}C$):

166 (Weast 1982–83, Horvath 1982)

Boiling Point ($^{\circ}C$):

sublimation (Weast 1982–83, Horvath 1982)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

141 (Wang et al. 1992)

195.9 (calculated-Le Bas method at normal boiling point)

Dissociation Constant pK_a :

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.041 (mp at $166^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.301 (shake flask-UV, Yalkowsky & Valvani 1980)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.86 (quoted, Wang et al. 1992)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

4.12 (calculated-fragment const., Yalkowsky et al. 1979, Valvani & Yalkowsky 1980)

3.98 (calculated, Müller & Klein 1992)

2.54; 3.89 (quoted; calculated-molar volume correlation, Wang et al. 1992)

4.05, 3.82 (predicted; calculated-atom typing scheme, Onel & Iseri 1997)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$ or $\log K_{\text{B}}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

6.1.6.6 3-Chloriodobenzene

Common Name: 3-Chloriodobenzene

Synonym: 3-chloro-1-iodobenzene

Chemical Name:

CAS Registry No: 625-99-0

Molecular Formula: $\text{ClC}_6\text{H}_4\text{I}$

Molecular Weight: 238.453

Melting Point ($^{\circ}\text{C}$):

Boiling Point ($^{\circ}\text{C}$):

230 (Weast 1982–83; Lide 2003)

Density (g/cm^3):

1.9515 (25°C , Weast 1982–83)

1.9255 (20°C , Horvath 1982)

Molar Volume (cm^3/mol):

150.2 (calculated-Le Bas method at normal boiling point)

124.9 (Rulle & Kesselring 1997)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C , F: 1.0

Water Solubility (g/m^3 or mg/L at 25°C):

68.8 (shake flask-UV, Yalkowsky et al. 1979; Yalkowsky & Valvani 1980)

67.4 (quoted, Horvath 1982; IUPAC Solubility Data Series, Horvath & Getzen 1985)

Vapor Pressure (Pa at 25°C):

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C):

Octanol/Water Partition Coefficient, $\log K_{\text{ow}}$:

4.12 (calculated-fragment const., Yalkowsky et al. 1979, Valvani & Yalkowsky 1980)

4.05, 3.82 (predicted; calculated-atom typing scheme, Onel & Iseri 1997)

3.98 (calculated, Müller & Klein 1992)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$ or $\log K_{\text{B}}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

6.1.6.7 4-Chloriodobenzene

Common Name: 4-Chloriodobenzene

Synonym: 4-chloro-1-iodobenzene

Chemical Name:

CAS Registry No: 637-87-6

Molecular Formula: $\text{ClC}_6\text{H}_4\text{I}$

Molecular Weight: 238.453

Melting Point ($^{\circ}\text{C}$):

57 (Weast 1982–83; Horvath 1982; Lide 2003)

Boiling Point ($^{\circ}\text{C}$):

227 (Weast 1982–83; Horvath 1982; Lide 2003)

Density (g/cm^3):

1.886 (57°C , Weast 1982–83; Horvath 1982)

Molar Volume (cm^3/mol):

122 (calculated-density, Lande & Banerjee 1981)

126.4 (Stephenson & Malanowski 19987; Rulle & Kesselring 1997)

127 (Wang et al. 1992)

150.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$, F: 0.4825)

Water Solubility (g/m^3 or mg/L at 25°C):

22.5 (shake flask-UV, Yalkowsky et al. 1979; Yalkowsky & Valvani 1980)

31.11 (quoted, IUPAC Solubility Data Series, Horvath & Getzen 1985)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

16.26 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_s/\text{kPa}) = 8.944 - 3200/(T/\text{K})$; temp range 303–323 K (Antoine eq.-I, solid state, Stephenson & Malanowski 1987)

$\log (P_l/\text{kPa}) = 5.63678 - 1465.651/(T/\text{K} - 102.487)$; temp range 333–500 K (Antoine eq.-II, Stephenson & Malanowski 1987)

Henry's Law Constant ($\text{Pa}\cdot\text{m}^3/\text{mol}$ at 25°C): k'

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

4.12 (calculated-fragment const., Yalkowsky et al. 1979, Valvani & Yalkowsky)

4.06 (HPLC- k' correlation, Hanai et al. 1981)

3.98 (calculated, Müller & Klein 1992)

4.47 (calculated-molar volume correlation, Wang et al. 1992)

4.34; 3.82 (predicted; calculated-atom typing scheme, Onel & Iseri 1997)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$ or $\log K_{\text{B}}$:

7 Polychlorinated Biphenyls (PCBs)

CONTENTS

7.1	List of Chemicals and Data Compilations	1484
7.1.1	PCB congeners	1484
7.1.1.0	Biphenyl	1484
7.1.1.1	2-Chlorobiphenyl (PCB-1)	1492
7.1.1.2	3-Chlorobiphenyl (PCB-2)	1497
7.1.1.3	4-Chlorobiphenyl (PCB-3)	1501
7.1.1.4	2,2'-Dichlorobiphenyl (PCB-4)	1508
7.1.1.5	2,3-Dichlorobiphenyl (PCB-5)	1511
7.1.1.6	2,3'-Dichlorobiphenyl (PCB-6)	1514
7.1.1.7	2,4-Dichlorobiphenyl (PCB-7)	1516
7.1.1.8	2,4'-Dichlorobiphenyl (PCB-8)	1519
7.1.1.9	2,5-Dichlorobiphenyl (PCB-9)	1522
7.1.1.10	2,6-Dichlorobiphenyl (PCB-10)	1525
7.1.1.11	3,3'-Dichlorobiphenyl (PCB-11)	1528
7.1.1.12	3,4-Dichlorobiphenyl (PCB-12)	1530
7.1.1.13	3,4'-Dichlorobiphenyl (PCB-13)	1533
7.1.1.14	3,5-Dichlorobiphenyl (PCB-14)	1535
7.1.1.15	4,4'-Dichlorobiphenyl (PCB-15)	1537
7.1.1.16	2,2',3-Trichlorobiphenyl (PCB-16)	1542
7.1.1.17	2,2',4-Trichlorobiphenyl (PCB-17)	1545
7.1.1.18	2,2',5-Trichlorobiphenyl (PCB-18)	1547
7.1.1.19	2,2',6-Trichlorobiphenyl (PCB-19)	1551
7.1.1.20	2,3,3'-Trichlorobiphenyl (PCB-20)	1553
7.1.1.21	2,3,4-Trichlorobiphenyl (PCB-21)	1555
7.1.1.22	2,3,4'-Trichlorobiphenyl (PCB-22)	1557
7.1.1.23	2,3,5-Trichlorobiphenyl (PCB-23)	1559
7.1.1.24	2,3,6-Trichlorobiphenyl (PCB-24)	1561
7.1.1.25	2,3',4-Trichlorobiphenyl (PCB-25)	1564
7.1.1.26	2,3',5-Trichlorobiphenyl (PCB-26)	1566
7.1.1.27	2,3',6-Trichlorobiphenyl (PCB-27)	1568
7.1.1.28	2,4,4'-Trichlorobiphenyl (PCB-28)	1570
7.1.1.29	2,4,5-Trichlorobiphenyl (PCB-29)	1574
7.1.1.30	2,4,6-Trichlorobiphenyl (PCB-30)	1578
7.1.1.31	2,4',5-Trichlorobiphenyl (PCB-31)	1580
7.1.1.32	2,4',6-Trichlorobiphenyl (PCB-32)	1584
7.1.1.33	2,3',4'-Trichlorobiphenyl (PCB-33)	1586
7.1.1.34	2,3',5'-Trichlorobiphenyl (PCB-34)	1589
7.1.1.35	3,3',4-Trichlorobiphenyl (PCB-35)	1591
7.1.1.36	3,3',5-Trichlorobiphenyl (PCB-36)	1593
7.1.1.37	3,4,4'-Trichlorobiphenyl (PCB-37)	1595
7.1.1.38	3,4,5-Trichlorobiphenyl (PCB-38)	1597

7.1.1.39	3,4',5-Trichlorobiphenyl (PCB-39)	1599
7.1.1.40	2,2',3,3'-Tetrachlorobiphenyl (PCB-40)	1601
7.1.1.41	2,2',3,4-Tetrachlorobiphenyl (PCB-41)	1604
7.1.1.42	2,2',3,4'-Tetrachlorobiphenyl (PCB-42)	1606
7.1.1.43	2,2',3,5-Tetrachlorobiphenyl (PCB-43)	1608
7.1.1.44	2,2',3,5'-Tetrachlorobiphenyl (PCB-44)	1610
7.1.1.45	2,2',3,6-Tetrachlorobiphenyl (PCB-45)	1613
7.1.1.46	2,2',3,6'-Tetrachlorobiphenyl (PCB-46)	1615
7.1.1.47	2,2',4,4'-Tetrachlorobiphenyl (PCB-47)	1617
7.1.1.48	2,2',4,5-Tetrachlorobiphenyl (PCB-48)	1620
7.1.1.49	2,2',4,5'-Tetrachlorobiphenyl (PCB-49)	1622
7.1.1.50	2,2',4,6-Tetrachlorobiphenyl (PCB-50)	1625
7.1.1.51	2,2',4,6'-Tetrachlorobiphenyl (PCB-51)	1627
7.1.1.52	2,2',5,5'-Tetrachlorobiphenyl (PCB-52)	1629
7.1.1.53	2,2',5,6'-Tetrachlorobiphenyl (PCB-53)	1636
7.1.1.54	2,2',6,6'-Tetrachlorobiphenyl (PCB-54)	1639
7.1.1.55	2,3,3',4-Tetrachlorobiphenyl (PCB-55)	1641
7.1.1.56	2,3,3',4'-Tetrachlorobiphenyl (PCB-56)	1643
7.1.1.57	2,3,3',5-Tetrachlorobiphenyl (PCB-57)	1645
7.1.1.58	2,3,3',5'-Tetrachlorobiphenyl (PCB-58)	1647
7.1.1.59	2,3,3',6-Tetrachlorobiphenyl (PCB-59)	1649
7.1.1.60	2,3,4,4'-Tetrachlorobiphenyl (PCB-60)	1651
7.1.1.61	2,3,4,5-Tetrachlorobiphenyl (PCB-61)	1654
7.1.1.62	2,3,4,6-Tetrachlorobiphenyl (PCB-62)	1658
7.1.1.63	2,3,4',5-Tetrachlorobiphenyl (PCB-63)	1660
7.1.1.64	2,3,4',6-Tetrachlorobiphenyl (PCB-64)	1662
7.1.1.65	2,3,5,6-Tetrachlorobiphenyl (PCB-65)	1664
7.1.1.66	2,3',4,4'-Tetrachlorobiphenyl (PCB-66)	1666
7.1.1.67	2,3',4,5-Tetrachlorobiphenyl (PCB-67)	1670
7.1.1.68	2,3',4,5'-Tetrachlorobiphenyl (PCB-68)	1672
7.1.1.69	2,3',4,6-Tetrachlorobiphenyl (PCB-69)	1674
7.1.1.70	2,3',4',5-Tetrachlorobiphenyl (PCB-70)	1676
7.1.1.71	2,3',4',6-Tetrachlorobiphenyl (PCB-71)	1680
7.1.1.72	2,3',5,5'-Tetrachlorobiphenyl (PCB-72)	1682
7.1.1.73	2,3',5',6-Tetrachlorobiphenyl (PCB-73)	1684
7.1.1.74	2,4,4',5-Tetrachlorobiphenyl (PCB-74)	1686
7.1.1.75	2,4,4',6-Tetrachlorobiphenyl (PCB-75)	1689
7.1.1.76	2,3',4',5'-Tetrachlorobiphenyl (PCB-76)	1691
7.1.1.77	3,3',4,4'-Tetrachlorobiphenyl (PCB-77)	1693
7.1.1.78	3,3',4,5-Tetrachlorobiphenyl (PCB-78)	1698
7.1.1.79	3,3',4,5'-Tetrachlorobiphenyl (PCB-79)	1700
7.1.1.80	3,3',5,5'-Tetrachlorobiphenyl (PCB-80)	1702
7.1.1.81	3,4,4',5-Tetrachlorobiphenyl (PCB-81)	1704
7.1.1.82	2,2',3,3',4-Pentachlorobiphenyl (PCB-82)	1706
7.1.1.83	2,2',3,3',5-Pentachlorobiphenyl (PCB-83)	1708
7.1.1.84	2,2',3,3',6-Pentachlorobiphenyl (PCB-84)	1710
7.1.1.85	2,2',3,4,4'-Pentachlorobiphenyl (PCB-85)	1712
7.1.1.86	2,2',3,4,5-Pentachlorobiphenyl (PCB-86)	1714
7.1.1.87	2,2',3,4,5'-Pentachlorobiphenyl (PCB-87)	1716
7.1.1.88	2,2',3,4,6-Pentachlorobiphenyl (PCB-88)	1719
7.1.1.89	2,2',3,4,6'-Pentachlorobiphenyl (PCB-89)	1721
7.1.1.90	2,2',3,4',5-Pentachlorobiphenyl (PCB-90)	1723
7.1.1.91	2,2',3,4',6-Pentachlorobiphenyl (PCB-91)	1725
7.1.1.92	2,2',3,5,5'-Pentachlorobiphenyl (PCB-92)	1727
7.1.1.93	2,2',3,5,6-Pentachlorobiphenyl (PCB-93)	1729

7.1.1.94	2,2',3,5,6'-Pentachlorobiphenyl (PCB-94)	1731
7.1.1.95	2,2',3,5',6-Pentachlorobiphenyl (PCB-95)	1733
7.1.1.96	2,2',3,6,6'-Pentachlorobiphenyl (PCB-96)	1736
7.1.1.97	2,2',3,4',5'-Pentachlorobiphenyl (PCB-97)	1738
7.1.1.98	2,2',3,4',6'-Pentachlorobiphenyl (PCB-98)	1741
7.1.1.99	2,2',4,4',5-Pentachlorobiphenyl (PCB-99)	1743
7.1.1.100	2,2',4,4',6-Pentachlorobiphenyl (PCB-100)	1746
7.1.1.101	2,2',4,5,5'-Pentachlorobiphenyl (PCB-101)	1748
7.1.1.102	2,2',4,5,6'-Pentachlorobiphenyl (PCB-102)	1755
7.1.1.103	2,2',4,5',6-Pentachlorobiphenyl (PCB-103)	1757
7.1.1.104	2,2',4,6,6'-Pentachlorobiphenyl (PCB-104)	1759
7.1.1.105	2,3,3',4,4'-Pentachlorobiphenyl (PCB-105)	1761
7.1.1.106	2,3,3',4,5-Pentachlorobiphenyl (PCB-106)	1765
7.1.1.107	2,3,3',4',5-Pentachlorobiphenyl (PCB-107)	1767
7.1.1.108	2,3,3',4,5'-Pentachlorobiphenyl (PCB-108)	1769
7.1.1.109	2,3,3',4,6-Pentachlorobiphenyl (PCB-109)	1771
7.1.1.110	2,3,3',4',6-Pentachlorobiphenyl (PCB-110)	1773
7.1.1.111	2,3,3',5,5'-Pentachlorobiphenyl (PCB-111)	1776
7.1.1.112	2,3,3',5,6-Pentachlorobiphenyl (PCB-112)	1778
7.1.1.113	2,3,3',5',6-Pentachlorobiphenyl (PCB-113)	1780
7.1.1.114	2,3,4,4',5-Pentachlorobiphenyl (PCB-114)	1782
7.1.1.115	2,3,4,4',6-Pentachlorobiphenyl (PCB-115)	1784
7.1.1.116	2,3,4,5,6-Pentachlorobiphenyl (PCB-116)	1786
7.1.1.117	2,3,4',5,6-Pentachlorobiphenyl (PCB-117)	1788
7.1.1.118	2,3',4,4',5-Pentachlorobiphenyl (PCB-118)	1790
7.1.1.119	2,3',4,4',6-Pentachlorobiphenyl (PCB-119)	1794
7.1.1.120	2,3',4,5,5'-Pentachlorobiphenyl (PCB-120)	1796
7.1.1.121	2,3',4,5',6-Pentachlorobiphenyl (PCB-121)	1798
7.1.1.122	2,3,3',4',5'-Pentachlorobiphenyl (PCB-122)	1800
7.1.1.123	2,3',4,4',5'-Pentachlorobiphenyl (PCB-123)	1802
7.1.1.124	2,3',4',5,5'-Pentachlorobiphenyl (PCB-124)	1804
7.1.1.125	2,3',4',5',6-Pentachlorobiphenyl (PCB-125)	1806
7.1.1.126	3,3',4,4',5-Pentachlorobiphenyl (PCB-126)	1808
7.1.1.127	3,3',4,5,5'-Pentachlorobiphenyl (PCB-127)	1811
7.1.1.128	2,2',3,3',4,4'-Hexachlorobiphenyl (PCB-128)	1813
7.1.1.129	2,2',3,3',4,5-Hexachlorobiphenyl (PCB-129)	1816
7.1.1.130	2,2',3,3',4,5'-Hexachlorobiphenyl (PCB-130)	1818
7.1.1.131	2,2',3,3',4,6-Hexachlorobiphenyl (PCB-131)	1820
7.1.1.132	2,2',3,3',4,6'-Hexachlorobiphenyl (PCB-132)	1822
7.1.1.133	2,2',3,3',5,5'-Hexachlorobiphenyl (PCB-133)	1824
7.1.1.134	2,2',3,3',5,6-Hexachlorobiphenyl (PCB-134)	1826
7.1.1.135	2,2',3,3',5,6'-Hexachlorobiphenyl (PCB-135)	1828
7.1.1.136	2,2',3,3',6,6'-Hexachlorobiphenyl (PCB-136)	1830
7.1.1.137	2,2',3,4,4',5-Hexachlorobiphenyl (PCB-137)	1833
7.1.1.138	2,2',3,4,4',5'-Hexachlorobiphenyl (PCB-138)	1835
7.1.1.139	2,2',3,4,4',6-Hexachlorobiphenyl (PCB-139)	1840
7.1.1.140	2,2',3,4,4',6'-Hexachlorobiphenyl (PCB-140)	1842
7.1.1.141	2,2',3,4,5,5'-Hexachlorobiphenyl (PCB-141)	1844
7.1.1.142	2,2',3,4,5,6-Hexachlorobiphenyl (PCB-142)	1847
7.1.1.143	2,2',3,4,5,6'-Hexachlorobiphenyl (PCB-143)	1849
7.1.1.144	2,2',3,4,5',6-Hexachlorobiphenyl (PCB-144)	1851
7.1.1.145	2,2',3,4,6,6'-Hexachlorobiphenyl (PCB-145)	1853
7.1.1.146	2,2',3,4',5,5'-Hexachlorobiphenyl (PCB-146)	1855
7.1.1.147	2,2',3,4',5,6-Hexachlorobiphenyl (PCB-147)	1857
7.1.1.148	2,2',3,4',5,6'-Hexachlorobiphenyl (PCB-148)	1859

7.1.1.149	2,2',3,4',5',6-Hexachlorobiphenyl (PCB-149)	1861
7.1.1.150	2,2',3,4',6,6'-Hexachlorobiphenyl (PCB-150)	1863
7.1.1.151	2,2',3,5,5',6-Hexachlorobiphenyl (PCB-151)	1865
7.1.1.152	2,2',3,5,6,6'-Hexachlorobiphenyl (PCB-152)	1868
7.1.1.153	2,2',4,4',5,5'-Hexachlorobiphenyl (PCB-153)	1870
7.1.1.154	2,2',4,4',5,6'-Hexachlorobiphenyl (PCB-154)	1877
7.1.1.155	2,2',4,4',6,6'-Hexachlorobiphenyl (PCB-155)	1879
7.1.1.156	2,3,3',4,4',5-Hexachlorobiphenyl (PCB-156)	1883
7.1.1.157	2,3,3',4,4',5'-Hexachlorobiphenyl (PCB-157)	1885
7.1.1.158	2,3,3',4,4',6-Hexachlorobiphenyl (PCB-158)	1887
7.1.1.159	2,3,3',4,5,5'-Hexachlorobiphenyl (PCB-159)	1889
7.1.1.160	2,3,3',4,5,6-Hexachlorobiphenyl (PCB-160)	1891
7.1.1.161	2,3,3',4,5',6-Hexachlorobiphenyl (PCB-161)	1893
7.1.1.162	2,3,3',4',5,5'-Hexachlorobiphenyl (PCB-162)	1895
7.1.1.163	2,3,3',4',5,6-Hexachlorobiphenyl (PCB-163)	1897
7.1.1.164	2,3,3',4',5',6-Hexachlorobiphenyl (PCB-164)	1899
7.1.1.165	2,3,3',5,5',6-Hexachlorobiphenyl (PCB-165)	1901
7.1.1.166	2,3,4,4',5,6-Hexachlorobiphenyl (PCB-166)	1903
7.1.1.167	2,3',4,4',5,5'-Hexachlorobiphenyl (PCB-167)	1905
7.1.1.168	2,3',4,4',5',6-Hexachlorobiphenyl (PCB-168)	1907
7.1.1.169	3,3',4,4',5,5'-Hexachlorobiphenyl (PCB-169)	1909
7.1.1.170	2,2',3,3',4,4',5-Heptachlorobiphenyl (PCB-170)	1911
7.1.1.171	2,2',3,3',4,4',6-Heptachlorobiphenyl (PCB-171)	1913
7.1.1.172	2,2',3,3',4,5,5'-Heptachlorobiphenyl (PCB-172)	1915
7.1.1.173	2,2',3,3',4,5,6-Heptachlorobiphenyl (PCB-173)	1917
7.1.1.174	2,2',3,3',4,5,6'-Heptachlorobiphenyl (PCB-174)	1919
7.1.1.175	2,2',3,3',4,5',6-Heptachlorobiphenyl (PCB-175)	1921
7.1.1.176	2,2',3,3',4,6,6'-Heptachlorobiphenyl (PCB-176)	1923
7.1.1.177	2,2',3,3',4,5',6'-Heptachlorobiphenyl (PCB-177)	1925
7.1.1.178	2,2',3,3',5,5',6-Heptachlorobiphenyl (PCB-178)	1927
7.1.1.179	2,2',3,3',5,6,6'-Heptachlorobiphenyl (PCB-179)	1929
7.1.1.180	2,2',3,4,4',5,5'-Heptachlorobiphenyl (PCB-180)	1931
7.1.1.181	2,2',3,4,4',5,6-Heptachlorobiphenyl (PCB-181)	1935
7.1.1.182	2,2',3,4,4',5,6'-Heptachlorobiphenyl (PCB-182)	1937
7.1.1.183	2,2',3,4,4',5',6-Heptachlorobiphenyl (PCB-183)	1939
7.1.1.184	2,2',3,4,4',6,6'-Heptachlorobiphenyl (PCB-184)	1941
7.1.1.185	2,2',3,4,5,5',6-Heptachlorobiphenyl (PCB-185)	1943
7.1.1.186	2,2',3,4,5,6,6'-Heptachlorobiphenyl (PCB-186)	1945
7.1.1.187	2,2',3,4',5,5',6-Heptachlorobiphenyl (PCB-187)	1947
7.1.1.188	2,2',3,4',5,6,6'-Heptachlorobiphenyl (PCB-188)	1950
7.1.1.189	2,3,3',4,4',5,5'-Heptachlorobiphenyl (PCB-189)	1952
7.1.1.190	2,3,3',4,4',5,6-Heptachlorobiphenyl (PCB-190)	1954
7.1.1.191	2,3,3',4,4',5',6-Heptachlorobiphenyl (PCB-191)	1956
7.1.1.192	2,3,3',4,5,5',6-Heptachlorobiphenyl (PCB-192)	1958
7.1.1.193	2,3,3',4',5,5',6-Heptachlorobiphenyl (PCB-193)	1960
7.1.1.194	2,2',3,3',4,4',5,5'-Octachlorobiphenyl (PCB-194)	1962
7.1.1.195	2,2',3,3',4,4',5,6-Octachlorobiphenyl (PCB-195)	1965
7.1.1.196	2,2',3,3',4,4',5,6'-Octachlorobiphenyl (PCB-196)	1967

7.1 LIST OF CHEMICALS AND DATA COMPILATIONS

7.1.1 PCB CONGENERS

7.1.1.0 Biphenyl

(See also [Chapter 4](#), Polynuclear Aromatic Hydrocarbons [PAHs] and Related Aromatic Hydrocarbons)

Common Name: Biphenyl

Synonym: diphenyl, phenylbenzene

Chemical Name: biphenyl

CAS Registry No: 92-52-4

Molecular Formula: $C_{12}H_{10}$

Molecular Weight: 154.207

Melting Point ($^{\circ}C$):

68.93 (Lide 2003)

Boiling Point ($^{\circ}C$):

256.1 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.866 ($20^{\circ}C$, Weast 1982–1983)

1.04 (Lide 2003)

Molar Volume (cm^3/mol):

148.3 ($20^{\circ}C$, calculated-density)

184.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

18.58 (Parks & Huffman 1931)

18.66 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

51.05 (Miller et al. 1984)

54.81, 59.2 (exptl., calculated-group additivity method, Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.371 (mp at $68.93^{\circ}C$)

0.35 (Mackay et al. 1980,1983; Shiu & Mackay 1986; Shiu et al. 1987)

0.381 (calculated, $\Delta S_{fus} = 54 J/mol K$, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5.94 (shake flask-UV, Andrews & Keefer 1949)

7.48* (shake flask-UV, measured range 0.4 – $42.8^{\circ}C$, Bohon & Claussen 1951)

3.87 (shake flask-UV, Sahyun 1966)

7.08* (shake flask-UV, measured range 0 – $64.5^{\circ}C$, Wauchope & Getzen 1972)

$R \cdot \ln x = -4520/(T/K) + 4.08 \times 10^{-4} \cdot [(T/K) - 298.15]^2 - 20.8 + 0.0273 \cdot (T/K)$, temp range 24.6 – $73.4^{\circ}C$ (shake flask-UV measurements, Wauchope & Getzen 1972)

7.45 (shake flask-GC, Eganhouse & Calder 1976)

7.0 (shake flask-fluorescence, Mackay & Shiu 1977)

8.50 (shake flask-nephelometry, Hollifield 1979)

7.51 (shake flask-LSC, Banerjee et al. 1980)

8.09 (TLC-RT correlation, Bruggeman et al. 1982)

6.71 (generator column-GC/ECD, Miller et al. 1984, 1985; quoted, Hawker 1989b)

7.09 (recommended, Pearlman et al. 1984)

7.05 (vapor saturation-UV, Akiyoshi et al. 1987)

6.5 ($29^{\circ}C$, shake flask-GC/FID; Stucki & Alexander 1987)

7.20, 7.55 (generator column-HPLC/UV, Billington et al. 1988)

9.96, 9.96, 9.96, 10.67 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

7.2* (recommended, IUPAC Solubility Data Series, Shaw 1989)

$\log [S_L/(\text{mol/L})] = 1.872 - 973.4/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\ln x = -1.5792 - 3669.26/(T/K)$, temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

5.37, 5.32 (generator column-GC/ECD, different flow rates, Oleszek-Kudlak et al. 2004)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

7933* (162.5°C, isoteniscope-manometer, measured range 162.5–255.2°C, Chipman & Peltier 1929)

104* (69.20°C, temp range 69.20–271.2°C, Cunningham 1930; quoted, Boublik et al. 1984)

133.3* (70.6°C, summary of literature data, temp range 70.6–254.0°C, Stull 1947)

1.30 (effusion method, measured range 4.0–34.5°C, Bright 1951)

$\log (P/\text{mmHg}) = 10.38 - 3799/(T/K)$; temp range: 4.0–34.5°C (Antoine eq., effusion, Bright 1951)

0.031 (manometry, Augood et al. 1953; selected, Bidleman 1984)

1.273* (effusion method, measured range 15.05–40.55°C, Bradley & Cleasby 1953)

$\log (P/\text{cmHg}) = 11.282 - 4263/(T/K)$; temp range 15.05–40.55°C (Antoine eq., Bradley & Cleasby 1953)

$\log (P/\text{mmHg}) = [-0.2185 \times 12910.0/(T/K)] + 8.218583$; temp range 70.6–254.9°C (Antoine eq., Weast 1972–73)

1.41* (effusion method, interpolated-Antoine eq., measured range 24.9–50.33°C, Radchenko & Kitiagorodskii 1974)

$\log (P/\text{mmHg}) = 12.6789 - 4367.436/(T/K)$; temp range; 24.9–50.33°C (Antoine eq., Knudsen effusion, Radchenko & Kitiagorodskii 1974)

2040* (123.0°C, pressure transducer, measured range 123.0–327.55°C, Nasir et al. 1980)

1.40 (HPLC-RT correlation, Swann et al. 1983)

$\log (P/\text{atm}) = [1 - 528.437/(T/K)] \times 10^4 \{0.821410 - 2.73337 \times 10^{-4} \cdot (T/K) + 1.02285 \times 10^{-7} \cdot (T/K)^2\}$; temp range: 342.35–673.15 K (Cox eq., Chao et al. 1983)

3.35, 3.41 (P_{GC} by GC-RT correlation, different GC columns, Bidleman 1984)

5.608 (supercooled liquid P_L , converted from literature P_S with ΔS_{fus} Bidleman 1984)

$\log (P/\text{kPa}) = 6.36895 - 1997.558/(202.608 + t/^\circ\text{C})$, temp range: 69.2–271.1°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

1.15* (24.7°C, gas saturation-GC/FID, measured range 5.2–24.7°C, Burkhard et al. 1984)

$\log (P/\text{Pa}) = 14.840 - 4402.1/(T/K)$, temp range: 5.2–24.7°C (gas saturation data, Clapeyron eq., Burkhard et al. 1984)

2.03 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

$\log (P/\text{mmHg}) = 7.24541 - 1998.725/(202.733 + t/^\circ\text{C})$, temp range: 69–271°C (Antoine eq., Dean 1985, 1992)

5.61; 6.62 (supercooled liquid P_L , quoted lit.; GC-RT correlation, Foreman & Bidleman 1985)

2.43; 6.90 (selected P_S ; supercooled liq. P_L , Shiu & Mackay 1986; Shiu et al. 1987; Sklarew & Girvin 1987)

1.443; 1.23 (P_S , interpolated-Antoine equations; Stephenson & Malanowski 1987)

$\log (P_S/\text{kPa}) = 11.71929 - 4143.054/(T/K)$; temp range 297–324 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_S/\text{kPa}) = 28.5175 - 21141.5/(374.85 + T/K)$; temp range: 283–342 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.37526 - 1794.8/(-74.85 + T/K)$, temp range: 390–563 K, (Antoine eq.-III, Stephenson & Malanowski 1987)

5.10, 5.00 (supercooled P_L , converted from literature P_S with different ΔS_{fus} values, Hinckley et al. 1990)

3.35 (P_{GC} by GC-RT correlation, Hinckley et al. 1990)

0.422–2.54; 2.03–7.04 (quoted range of lit. P_S values; lit. P_L values, Delle Site 1997)

5.31; 2.02 (quoted supercooled liquid P_L from Hinckley et al. 1990; converted to solid P_S with fugacity ratio F , Passivirta et al. 1999)

$\log (P_S/\text{Pa}) = 11.05 - 3201/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/\text{Pa}) = 8.20 - 2228/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\log (P/\text{kPa}) = 14.840 - 4402.1/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

3.63; 0.822 (supercooled liquid P_L , calibrated GC-RT correlation; GC-RT correlation, Lei et al. 2002)

$\log (P_L/\text{Pa}) = -3265/(T/K) + 11.51$; $\Delta H_{vap} = -62.5 \text{ kJ}\cdot\text{mol}^{-1}$ (GC-RT correlation, Lei et al. 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 41.34 (batch stripping-GC, Mackay et al. 1979)
- 30.4 (batch stripping-GC, Mackay et al. 1980;)
- 11.55 (gas stripping-GC, Warner et al. 1987)
- 19.57 (wetted-wall column-GC, Fendinger & Glotfelty 1990)
- 31.20 (gas stripping-GC, Shiu & Mackay 1997)
- $\log [H/(\text{Pa m}^3/\text{mol})] = 6.33 - 1255/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 3.16 (shake flask-UV, Rogers & Cammarata 1969)
- 4.09 (shake flask, Leo et al. 1971; Hansch & Leo 1979)
- 4.04 (shake flask, Hansch et al. 1973)
- 4.17, 4.09, 3.16, 4.04 (Neely et al. 1974; Hansch & Leo 1979)
- 3.95 (HPLC- k' correlation, Rekker & De Kort 1979)
- 3.75 (HPLC-RT correlation, Veith et al. 1979a)
- 4.04 (shake flask-HPLC, Banerjee et al. 1980)
- 3.88 (lit. average, Kenaga & Goring 1980)
- 4.10 (RP-TLC- k' correlation, Bruggeman et al. 1982)
- 4.08 (HPLC- k' correlation, Hammers et al. 1982)
- 3.70 (HPLC-RT correlation, Woodburn 1982; Woodburn et al. 1984)
- 3.16–4.09, 3.91 (shake flask, range, average, Eadsforth & Moser, 1983)
- 3.91–4.15, 4.05 (HPLC, range, average, Eadsforth & Moser 1983)
- 4.03 (HPLC- k' correlation, Hafkenscheid & Tomlinson 1983)
- 3.93 (HPLC correlation; Harnisch et al. 1983)
- 3.76 (generator column-GC/ECD, Miller et al. 1984,1985)
- 3.89 (generator column-HPLC, Woodburn et al. 1984)
- 3.79 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 4.11–4.13 (HPLC-RV correlation, quoted exptl., Garst 1984)
- 4.10 (HPLC-RV correlation, Garst & Wilson 1984)
- 4.05 (HPLC-RT correlation, Eadsforth 1986)
- 3.81 (shake flask-GC, Menges & Armstrong 1986)
- 4.13 (HPLC-RT correlation, Wang et al. 1991)
- 3.63 (HPLC- k' correlation; De Kock & Lord 1987)
- 3.89 (generator column-GC, Doucette & Andren 1987,1988)
- 4.14, 4.06, 4.00, 3.94 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 3.69 (HPLC-RT correlation, Doucette & Andren 1988)
- 3.75 (HPLC-RT correlation, Sherblom & Eganhouse 1988)
- 4.008; 4.10 (slow stirring-GC; calculated- π const., De Bruijn et al. 1989; De Bruijn & Hermens 1990)
- 3.98 (recommended, Sangster 1989, 1993)
- 4.29 (dual-mode centrifugal partition chromatography, Gluck & Martin 1990)
- 4.26 (HPLC- k' correlation, Noegrohati & Hammers 1992)
- 4.01 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 6.92, 6.09; 6.09 (0, 20°C , multi-column GC- k' correlation; calculated at 20°C , Zhang et al. 1999)
- 6.15 (calculated- S_{oct} and vapor pressure P, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

- 2.64 (trout, calculated- k_1/k_2 , Neely et al. 1974)
- 3.12 (rainbow trout, Veith et al. 1979; Veith & Kosian 1983)
- 2.53 (fish, flowing water, Kenaga & Goring 1980; Kenaga 1980)
- 2.73, 2.45, 3.41 (algae, fish, activated sludge, Freitag et al. 1985)

Sorption Partition Coefficient, log K_{OC} :

- 3.15 (soil, Kenaga 1980)
 3.0, 3.27 (Aldrich humic acid, reversed phase separation, Landrum et al. 1984)
 3.57, 3.77 (humic materials in aqueous solutions: RP-HPLC-LSC, equilibrium dialysis, Lake Erie water with 9.6 mg/L DOC, Landrum et al. 1984)
 5.58, 4.04 (humic materials in aqueous solutions: RP-HPLC-LSC, equilibrium dialysis, Huron River with 7.8 mg/L DOC, Landrum et al. 1984)
 5.68, 5.34, 5.23, 3.57 (humic materials in natural water: Huron River 6.7% DOC spring, Grand River 10.7% DOC spring, Lake Michigan 4.7% DOC spring, Lake Erie 9.6% DOC spring, RP-HPLC separation method, Landrum et al. 1984)
 3.52, 2.94 (Apison soil 0.11% OC, Dormont soil 1.2% OC, batch equilibrium, Southworth & Keller 1986)
 3.40 (calculated, soil, Chou & Griffin 1986)
 3.04, 3.32, 3.26, 3.04, 3.08 (5 soils: clay loam/kaolinite, light clay/montmorillonite, light clay/montmorillite, sandy loam/allophane, clay loam/allophane, batch equilibrium-sorption isotherm, Kishi et al. 1990)
 4.20; 3.30 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)
 3.03, 3.12 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, average values, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

- Volatilization/Evaporation: $t_{1/2} = 7.52$ d evaporation from water depth of 1 m (Mackay & Leinonen 1975)
 rate of volatilization $k = 0.92 \text{ g m}^{-2} \text{ h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).
 Photolysis: $k = 5.1 \times 10^{-4} \text{ h}^{-1}$ to $7.4 \times 10^{-3} \text{ h}^{-1}$ with H_2O_2 under photolysis at 25°C in F-113 solution and with HO^- in the gas (Dilling et al. 1988);
 photodegradation $k = 5.1 \times 10^{-4} \text{ min}^{-1}$ and $t_{1/2} = 22.61$ h in methanol-water (3:7, v/v) with initial concentration of 16.2 ppm by high pressure mercury lamp or sunlight (Wang et al. 1991).
 Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH} = (8.06 \pm 0.77) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with an estimated lifetime of ~ 3 d, and $k_{O_3} < 2.0 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294 ± 1 K (relative rate method, Atkinson et al. 1984)
 $k_{OH} = (8.5 \pm 0.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (relative rate method, Atkinson & Aschmann 1985)
 $k_{OH} = (7 \pm 2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1985)
 $k_{OH}(\text{calc}) = 7.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = (5.8 - 8.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 3 d (Atkinson 1987a)
 $k_{OH}(\text{calc}) = 7.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 7.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (SAR structure-activity relationship, Atkinson 1987b)
 $k_{O_3} < 2 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k_{OH} = 7.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k_{N_2O_5} < 2.0 \times 10^{-19} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with N_2O_5 at room temp (Atkinson & Aschmann 1988)
 $k_{OH}^* = 7.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)
 $k_{OH}(\text{calc}) = 6.44 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (molecular orbital calculations, Klamt 1993)
 $k_{OH}(\text{exptl}) = 7.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 6.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 2.0 d (Kwok et al. 1995)

Hydrolysis:

- Biodegradation: 100% degraded by activated sludge in 47 h cycle (Monsanto Co. 1972)
 $k = 109 \text{ yr}^{-1}$ in the water column and $k = 1090 \text{ yr}^{-1}$ in the sediment, microbial degradation pseudo first-order rate constant (Wong & Kaiser 1975; selected, Neely 1981)
 $k = 9.3\text{--}9.8 \text{ nmol L}^{-1} \text{ d}^{-1}$ with an initial biphenyl concentration of $4.4\text{--}4.7 \text{ } \mu\text{mol/L}$, and $k = 3.2 \text{ nmol L}^{-1} \text{ d}^{-1}$ with initial concentration of $2.9 \text{ } \mu\text{mol/L}$, rate of biodegradation in water from Port Valdez (estimated, Reichardt et al. 1981)
 $t_{1/2} = 1.5$ d, estimated by using water die-away test (Bailey et al. 1983)
 $t_{1/2}(\text{aq. aerobic}) = 36\text{--}168$ h, based on river die-away test data and activated sludge screening test data (Howard et al. 1991)
 $t_{1/2}(\text{aq. anaerobic}) = 144\text{--}672$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

removal rate of 5.3 and 0.52 mg (g of volatile suspended solid d)⁻¹, degradation by bacteria from creosote-contaminated marine sediments with nitrate- and sulfate-reducers, respectively, under anaerobic conditions in a fluidized bed reactor (Rockne & Strand 1998)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 6.79 \text{ h}^{-1}$; $k_2 = 0.0155 \text{ h}^{-1}$ (trout muscle, Neely et al. 1974; Neely 1979)

$k_1 = 6.8 \text{ h}^{-1}$; $1/k_2 = 65 \text{ h}$ (trout, quoted, Hawker & Connell 1985)

$\log k_1 = 2.21 \text{ d}^{-1}$; $\log 1/k_2 = 0.43 \text{ d}$ (fish, Connell & Hawker 1988)

$\log k_2 = -0.43 \text{ d}^{-1}$ (fish, quoted, Thomann 1989)

Half-Lives in the Environment:

Air: calculated lifetime of ~3 d due to reaction with OH radical, assuming an average daytime atmospheric OH radical concn of $\sim 1 \times 10^6 \text{ molecule/cm}^3$ (Atkinson et al. 1984);

estimated atmospheric lifetime of ~2.7 d due to reaction with the OH radical for a 24-h average OH radical concn of $5 \times 10^5 \text{ cm}^{-3}$ (Atkinson & Aschmann 1985);

calculated tropospheric lifetime of 9 d due to the rate constants of gas-phase reaction with OH radical (Atkinson 1987);

$t_{1/2} = 7.8\text{--}110 \text{ h}$, based on photooxidation half-life in air (Howard et al. 1991);

tropospheric lifetime of 2.0 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for biphenyl (Kwok et al. 1995).

Surface water: $t_{1/2} \sim 1.5 \text{ d}$ in river water (Bailey et al. 1983);

$t_{1/2} = 36\text{--}168 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);
photolysis $t_{1/2} = 19.18 \text{ min}$ in aqueous solution when irradiated with a 500W medium pressure mercury lamp (Chen et al. 1996).

Groundwater: $t_{1/2} = 72\text{--}336 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Sediment:

Soil: $t_{1/2} = 36\text{--}168 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

Biota: estimated $t_{1/2} = 29 \text{ h}$ from fish in simulated ecosystem (Neely 1980).

7.1.1.1 2-Chlorobiphenyl (PCB-1)

Common Name: 2-Chlorobiphenyl

Synonym: PCB-1, *o*-chlorobiphenyl, 2-chloro-1,1'-biphenyl

Chemical Name: 2-chlorobiphenyl

CAS Registry No: 2051-60-7

Molecular Formula: C₁₂H₉Cl

Molecular Weight: 188.652

Melting Point (°C):

34 (Beaven et al. 1961; Weast 1972–73, 1982–83; Lide 2003)

Boiling Point (°C):

274 (Weast 1972–73, 1982–83; Lide 2003)

Density (g/cm³ at 20°C): 0.9837

Molar Volume (cm³/mol):

205.5 (calculated-Le Bas method at normal boiling point)

172.9 (Ruelle & Kesselring 1997)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

57.8 (Geidarov et al. 1975)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

72.3 (Geidarov et al. 1975)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

14.52 (Geidarov et al. 1975)

15.3 (differential scanning calorimetry, Miller et al. 1984)

14.54 (Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

47.66 (Geidarov et al. 1975)

50.21 (Miller et al. 1984)

Fugacity Ratio at 25°C, F (assuming ΔS_{fus} = 56 J/mol K), F: 0.816 (mp at 34°C)

Water Solubility (g/m³ or mg/L at 25°C):

1.60 (Webb 1970)

0.90 (Hoover 1971)

5.90 (shake flask-GC/ECD, Wallnöfer et al. 1973)

4.13 (generator column-GC/ECD, Weil et al. 1974)

5.08 (supercooled liquid S_L, shake flask-GC/ECD, Chiou et al. 1983)

5.06 (generator column-GC/ECD, Miller et al. 1984,1985)

4.13, 4.74, 14.0, 4.13 (RP-HPLC-*k'* correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (89.3°C, summary of literature data, temp range 89.3–267.5°C, Stull 1947)

log (P/mmHg) = (8.306 ± 0.087) – (3018 ± 45)/(T/K), temp range: 410–510 K (static method-quartz manometer measurements, Geidarov et al. 1975)

1.84 (supercooled liquid P_L, extrapolated Antoine eq., Weast 1976–77)

1.12 (Neely 1981,1983)

0.605; 0.159; 0.367* (Knudsen effusion; torsion effusion; torsion-Knudsen effusion, extrapolated from exptl. derived Antoine eq., measured range 33–110°C, Ferro et al. 1983)

$\log (P_L/\text{kPa}) = -3893/(T/\text{K}) + 9.99$; temp range: 33–77°C (Knudsen effusion data, Ferro et al. 1983)
 $\log (P_L/\text{kPa}) = -4406/(T/\text{K}) + 10.98$; temp range: 64–110°C (torsion effusion data, liquid, Ferro et al. 1983)
 $\log (P_L/\text{kPa}) = -(4149 \pm 230)/(T/\text{K}) + (10.48 \pm 0.50)$; temp range: 33–110°C (torsion-Knudsen effusion data, Ferro et al. 1983)
 1.096, 1.456 (P_{GC} by GC-RT correlation, different stationary phases, Bidleman 1984)
 1.892, 2.56 (supercooled liquid P_L from P_{GC} , GC-RT correlation, different stationary phases, Bidleman 1984)
 0.755 (GC-RI correlation, Burkhard et al. 1985a)
 0.926 (GC-RI correlation, supercooled liquid P_L , Burkhard et al. 1985b)
 2.20 (supercooled liquid P_L , GC-RT correlation, Foreman & Bidleman 1985)
 1.096 (P_{GC} by GC-RT correlation with eicosane as reference standard, Hinckley et al. 1990)
 $\log (P_L/\text{Pa}) = -3366/(T/\text{K}) + 11.57$ (GC-RT correlation, Falconer & Bidleman 1994)
 0.27–2.70; 0.367–2.56 (literature P_s range; literature supercooled liquid P_L range, Delle Site 1997)
 $\log (P/\text{kPa}) = 9.99 - 3893/(T/\text{K})$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

28.9 (calculated-P/C, Burkhard et al. 1985b)
 70.1 (calculated-P/C, Shiu & Mackay 1986)
 74.6 (Dow Chemical, Neely 1982)
 30.18 (calculated-QSPR, Dunnivant et al. 1992)
 5.13, 8.32, 13.17, 20.43 ± 0.52 , 29.3 (4, 11, 18, 25, 31°C, gas stripping-GC, Bamford et al. 2000)
 $K_{AW} = \exp[-(42.7/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.104/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C (gas stripping-GC, Bamford et al. 2000)
 22.0 (gas stripping-GC, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 43 \pm 6 \text{ kJ/mol}$, $\Delta S_H = 0.10 \pm 0.02 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.54 (shake flask-GC, Tulp & Hutzinger 1978)
 4.80 (Hansch & Leo 1979)
 4.35 (HPLC-RT correlation, Veith et al. 1979)
 4.10 (HPLC-RT correlation, McDuffie 1981)
 4.59 ± 0.1 ; 4.56 (shake flask-GC; RP-TLC- k' correlation, Bruggeman et al. 1982)
 3.75 (HPLC-RT correlation, Woodburn 1982)
 4.51 (shake flask-GC, Chiou et al. 1983)
 4.50 (generator column-GC, Miller et al. 1984, 1985)
 4.38 (generator column-HPLC, Woodburn et al. 1984)
 3.90, 4.60 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
 4.44 (HPLC-RP/MS correlation, Burkhard & Kuehl 1986)
 4.38 (generator column-GC/ECD, Doucette & Andren 1987)
 4.33, 4.39, 4.53, 4.43 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 3.92 (HPLC-RT correlation, Doucette & Andren 1988)
 4.531 ± 0.029 (shake flask/slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 4.52 (recommended, Sangster 1989, 1993)
 4.68 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 4.53 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated:

7.54, 6.65 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 6.04 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, log K_{OC} :

- 3.50 (Woodburn silt loam soil, batch equilibrium isotherm-GC/ECD, Chiou et al. 1983)
 4.35 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 3.47 (calculated, soil, Chou & Griffin 1986)
 2.59 (Borden soil 0.29% OC, Hu et al. 1995)

Sorption Partition Coefficient, log K_{OM} :

- 3.23 (soil organic matter, equilibrium sorption isotherm-GC/ECD, Chiou et al. 1983)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

$k(\text{calc}) = 3.7 \times 10^{-4} \text{ d}^{-1}$ and with $t_{1/2} = 18 \text{ yr}$, calculated sunlight photolysis rate constant in surface water at 40°N in summer (Dulin et al. 1986)

$k(\text{calc}) = 3.0 \text{ h}^{-1}$ maximum summer photolysis rate, at midday under clear skies (Bunce et al. 1989)
 $t_{1/2} = 31 \text{ d}$ under sunlight in water (Mansour & Feicht 1994)

$k = 0.081 \text{ min}^{-1}$ at pH 3, $k = 0.045 \text{ min}^{-1}$ at pH 7 and $k = 0.035 \text{ min}^{-1}$ at pH 10 with half-lives of 9, 15 and 20 min, respectively, in aqueous solutions when irradiated by UVA-340 light tubes in the presence of 25 $\mu\text{g/mL}$ of TiO_2 ;

$k = (0.043\text{--}0.045) \text{ min}^{-1}$ with $t_{1/2} = 15\text{--}16 \text{ min}$, $k = (0.082\text{--}0.091) \text{ min}^{-1}$ with $t_{1/2} = 8 \text{ min}$, and $k = (0.21\text{--}0.29) \text{ min}^{-1}$ with $t_{1/2} = 2\text{--}3 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively;
 $k = (0.043\text{--}0.044) \text{ min}^{-1}$ with $t_{1/2} = 15\text{--}16 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ;

$k = (0.030\text{--}0.055) \text{ min}^{-1}$ with $t_{1/2} = 13\text{--}22 \text{ min}$ in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (2.9 \pm 0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K with estimated atmospheric lifetime of ~8 d (relative rate method, Atkinson & Aschmann 1985)

$k_{OH} = 1.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ to the $\text{C}_6\text{H}_4\text{Cl}$ ring (ring B), $k_{OH} = 1.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ to ring A, and $k_{OH} = 2.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (observed ring A + ring B) with a calculated tropospheric lifetime of 5–11 d (Atkinson 1987)

$k_{OH}(\text{calc}) = (2.8\text{--}5.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = (3.1\text{--}4.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for mono-chlorobiphenyls, the tropospheric lifetime was calculated to be 5–11 d (Atkinson 1987)

$k_{OH} = 2.82 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (Atkinson 1989)

$k_{OH}(\text{exptl}) = (2.8\text{--}5.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = (3.2\text{--}4.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, the tropospheric lifetime is calculated to be 2.7–5.1 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: $t_{1/2} = 100 \text{ h}$ biodegradation by bacteria (Wong & Kaiser 1975);

within 7 h by *Alcaligenes* sp. strain Y-42 from lake sediments (Furukawa & Matsumura 1976; quoted, Pal et al. 1980);

$k = 63 \text{ yr}^{-1}$ microbial degradation pseudo first-order rate constant of in the water column and $k = 630 \text{ yr}^{-1}$ in the sediment (Wong & Kaiser 1975; quoted, Neely 1981);

$k = 4.1 \text{ nmol L}^{-1} \text{ d}^{-1}$ biodegradation rate in water from Port Valdez with an initial concn of 1.5 $\mu\text{mol/L}$ (data of Aug. 1977, Reichardt et al. 1981) and $k = 1.2 \text{ nmol L}^{-1} \text{ d}^{-1}$ with initial concn of 4.5 $\mu\text{mol/L}$ (data of Aug. 1978, Reichardt et al. 1981); and $t_{1/2} = 2\text{--}3.5 \text{ d}$, an initial concn of 1–100 $\mu\text{g/L}$ by river dieaway test (Bailey et al. 1983)

$k = 1.10 \mu\text{g mL}^{-1} \text{ d}^{-1}$, the degradation rate at 30 $\mu\text{g mL}^{-1}$, under culture conditions include river water as supportive medium and mixed bacterial cultures obtained from river sediments (Kong & Sayler 1983).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: estimated atmospheric lifetime of ~8 d due to reaction with the OH radical for a 24-h average OH radical concn of $5 \times 10^5 \text{ cm}^{-3}$ (Atkinson & Aschmann 1985);
 calculated tropospheric lifetime of 5–11 d due to calculated rate constant of gas-phase reaction with OH radical for mono-chlorobiphenyls (Atkinson 1987);
 photolysis $t_{1/2}$ ~10–25 h for noontime summer sunshine, or more realistically, several days (Bunce et. 1989);
 tropospheric lifetime of 3 d calculated based on reaction principally with OH radical and other photochemical reactions (Bunce et al. 1991);
 tropospheric lifetime of 2.7–5.1 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for mono-chlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2}$ = 1.4 d in Lake Michigan (Neely 1983);
 photolysis $t_{1/2}$ = 18 yr in surface water at 40° L in summer (Dulin et al. 1986);
 photolysis $t_{1/2}$ = 31 d under sunlight (Mansour & Feicht 1994);
 half-lives in aqueous solutions with initial concn of 265 ng/mL, $t_{1/2}$ = 9 min at pH 3, $t_{1/2}$ = 15 min at pH 7 and $t_{1/2}$ = 20 min at pH 10 when irradiated by UVA-340 light tubes (simulated sun light) in the presence of 25 µg/mL TiO_2 , half-lives of 15–16 min, 8 min and 2–3 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 µg/mL TiO_2 , respectively; half-lives of 15–16 min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 µg/mL TiO_2 ; $t_{1/2}$ = 13–22 min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 µg/mL TiO_2 (Huang et al. 1996).

FIGURE 7.1.1.1.1 Logarithm of vapor pressure and Henry's law constant versus reciprocal temperature for 2-chlorobiphenyl (PCB-1).

7.1.1.2 3-Chlorobiphenyl (PCB-2)

Common Name: 3-Chlorobiphenyl

Synonym: PCB-2, *m*-chlorobiphenyl, 3-chloro-1,1'-biphenyl

Chemical Name: 3-chlorobiphenyl

CAS Registry No: 2051-61-8

Molecular Formula: $C_{12}H_9Cl$

Molecular Weight: 188.652

Melting Point ($^{\circ}C$):

16 (Weast 1972–73, 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

284.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$): 0.9837

Molar Volume (cm^3/mol):

205.5 (calculated-Le Bas method at normal boiling point)

172.9 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

15.31 (Miller et al. 1984)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 1.0 (mp at $16^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3.50 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

1.30 (generator column-GC/ECD, Weil et al. 1974)

0.56, 0.82, 0.88, 0.86 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

3.63 (generator column-HPLC/UV, Billington et al. 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.723 (extrapolated P_L , Antoine eq., Weast 1972–73)

0.711; 4.01; 0.362* (Knudsen effusion; torsion effusion; torsion-Knudsen effusion, extrapolated from exptl. derived Antoine eq., measured range 37 – $129^{\circ}C$, Ferro et al. 1983)

$\log(P_L/kPa) = -3458/(T/K) + 8.45$; temp range: 37 – $86^{\circ}C$ (Knudsen effusion data, liquid, Ferro et al. 1983)

$\log(P_L/kPa) = -3371/(T/K) + 8.91$; temp range: 68 – $129^{\circ}C$ (torsion effusion data, liquid, Ferro et al. 1983)

$\log(P_L/kPa) = -(3614 \pm 188)/(T/K) + (8.68 \pm 0.47)$; temp range: 37 – $129^{\circ}C$ (torsion-Knudsen effusion data, Ferro et al. 1983)

0.98, 1.01 (supercooled P_L , GC-RT correlation with different stationary phases, Bidleman 1984)

0.366 (GC-RI correlation, Burkhard et al. 1985a)

0.362 (liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.997 (liquid P_L , GC-RT correlation, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -3476/(T/K) + 11.65$ liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.220–1.01 (quoted lit. range, Delle Site 1997)

$\log(P/Pa) = 11.64178 - 3514.98/(T/K)$ temp range 5 – $50^{\circ}C$ (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

14.49 (calculated- P/C , Burkhard et al. 1985b)

75.55 (calculated- P/C , Shiu & Mackay 1986)

62.11 (Dow Chemical, Neely 1982)

27.78 (calculated-QSAR, Dunnivant et al. 1992)

- 20.3 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 54 \pm 3$ kJ/mol, $\Delta S_H = 0.14 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 4.54 (shake flask-GC/ECD, Tulp & Hutzinger 1978)
 4.35 (HPLC-RT correlation, Veith et al. 1979)
 4.80 (Hansch & Leo 1979)
 4.71 \pm 0.1 (shake flask-GC/ECD, Bruggeman et al. 1982)
 4.72 (RP-TLC-retention time correlation, Bruggeman et al. 1982)
 4.35 (HPLC-RT correlation, Woodburn 1982)
 4.58 (generator column-HPLC, Woodburn et al. 1984)
 3.75 (HPLC-RT correlation, Woodburn et al. 1984)
 4.60 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
 4.60 (selected, Shiu & Mackay 1986)
 4.58 (generator column-GC/ECD, Doucette & Andren 1987)
 4.65 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
 4.58 (recommended, Sangster 1989, 1993)
 4.72 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 4.58 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 7.86, 6.99 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 6.88 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.42 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 3.62 (calculated-S, soil, Chou & Griffin 1986)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

$t_{1/2} = 45$ d under sunlight in water (Mansour & Feicht 1994)
 $k(\text{calc}) = 0.5 \text{ h}^{-1}$, maximum summer photolysis rate, at midday under clear skies (Bunce et al. 1989)
 $k = (0.036\text{--}0.045) \text{ min}^{-1}$ with $t_{1/2} = 15\text{--}19$ min, $k = (0.069\text{--}0.085) \text{ min}^{-1}$ with $t_{1/2} = 8\text{--}10$ min, and
 $k = (0.18\text{--}0.23) \text{ min}^{-1}$ with $t_{1/2} = 3\text{--}4$ min in aqueous Aroclor 1248 solution containing 45 ng/mL
 of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively;
 rate constant of $k = (0.027\text{--}0.042) \text{ min}^{-1}$ with $t_{1/2} = 16\text{--}26$ min in aqueous Aroclor mixtures (Aroclor
 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in
 the presence of 100 $\mu\text{g/mL}$ TiO_2 ;
 $k = (0.033\text{--}0.036) \text{ min}^{-1}$ with $t_{1/2} = 19\text{--}21$ min in St. Lawrence River water containing 3 ng/mL of
 total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3}
 with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH} = (5.4 \pm 0.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 ± 1 K, with an estimated atmospheric lifetime
 of ~ 4 d (relative rate method, Atkinson & Aschmann 1985)
 $k_{OH} = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ to the $\text{C}_6\text{H}_4\text{Cl}$ ring (ring B), $k_{OH} = 1.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1}$
 s^{-1} to ring A, and $k_{OH} = 5.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (observed ring A + ring B) with a calculated
 tropospheric lifetime of 5–11 d (Atkinson 1987)
 $k_{OH}(\text{calc}) = (2.8\text{--}5.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = (3.1\text{--}4.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1}$
 s^{-1} for mono-chlorobiphenyls, the tropospheric lifetime was calculated to be 5–11 d (Atkinson
 1987)
 $k_{OH} = 5.28 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (Atkinson 1989)

$k_{\text{OH}}(\text{exptl}) = (2.8 - 5.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = (3.2 - 4.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$,
the tropospheric lifetime is calculated to be 2.7–5.1 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: biodegradation $t_{1/2} \approx 7 \text{ h}$ by *Alcaligenes* sp. strain Y-42 from lake sediments (Furukawa & Matsumura 1976; selected, Pal et al. 1980);
biodegradation rate $k \sim 2.6 \text{ nmol L}^{-1} \text{ d}^{-1}$ with an initial concentration of $3.6 \text{ } \mu\text{mol L}^{-1}$ in water from Port Valdez estimated to be (data of August 1977, Reichardt et al. 1981);
biodegradation $t_{1/2} \sim 3\text{--}4 \text{ d}$ for 50% initial concentration of $1\text{--}100 \text{ } \mu\text{g L}^{-1}$ by river dieaway test (Bailey et al. 1983);
degradation rate $k = 1.6 \text{ } \mu\text{g mL}^{-1} \text{ d}^{-1}$ at $30 \text{ } \mu\text{g mL}^{-1}$ under culture conditions include river water as supportive medium and mixed bacterial cultures obtained from river sediments (Kong & Saylor 1983).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 0.29 \text{ d}^{-1}$, 0.13 d^{-1} , 0.11 d^{-1} , 0.11 d^{-1} (golden orfe, carp, brown trout, guppy, Sugiura et al. 1979)

Half-Lives in the Environment:

Air: estimated atmospheric lifetime of $\sim 4 \text{ d}$ due to reaction with the OH radical for a 24-h average OH radical concn of $5 \times 10^5 \text{ cm}^{-3}$ (Atkinson & Aschmann 1985);
calculated tropospheric lifetime of 5–11 based on the calculated rate constant of gas-phase reaction with OH radicals for mono-chlorobiphenyls (Atkinson 1987);
tropospheric lifetime of 2 d calculated based on reaction principally with OH radical and other photochemical reactions (Bunce et al. 1991);
tropospheric lifetime of 2.7–5.1 d based on both the experimentally determined and calculated rate constant for reaction with OH radical for mono-chlorobiphenyls (Kwok et al. 1995).

Surface water: photolysis $t_{1/2} = 45 \text{ d}$ under sunlight in water (Mansour & Feicht 1994);

$t_{1/2} = 15\text{--}19 \text{ min}$, $8\text{--}10 \text{ min}$ and $3\text{--}4 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and $100 \text{ } \mu\text{g/mL}$ TiO_2 , respectively;
 $t_{1/2} = 16\text{--}26 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of $100 \text{ } \mu\text{g/mL}$ TiO_2 ;
 $t_{1/2} = 19\text{--}21 \text{ min}$ in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of $100 \text{ } \mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

FIGURE 7.1.1.2.1 Logarithm of vapor pressure versus reciprocal temperature for 3-chlorobiphenyl (PCB-2).

7.1.1.3 4-Chlorobiphenyl (PCB-3)

Common Name: 4-Chlorobiphenyl

Synonym: PCB-3, *p*-chlorobiphenyl, 4-chloro-1,1'-biphenyl

Chemical Name: 4-chlorobiphenyl

CAS Registry No: 2051-62-9

Molecular Formula: C₁₂H₉Cl

Molecular Weight: 188.652

Melting Point (°C):

78.8 (Lide 2003)

Boiling Point (°C):

292.9 (Lide 2003)

Density (g/cm³ at 20°C): 0.9837

Molar Volume (cm³/mol):

205.5 (calculated-Le Bas method at normal boiling point)

172.9 (Ruelle & Kesselring 1997)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

65.94 (Geidarov et al. 1975)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

79.24 (Geidarov et al. 1975)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

13.32 (Geidarov et al. 1975; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.297 (mp at 78.8°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.0 (Webb 1970)

0.40 (Hoover, 1971)

1.19 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.90 (generator column-GC/ECD, Weil et al. 1974)

1.65 (Branson 1977)

0.0151 (shake flask-GC/ECD from Aroclor 1242, Lee et al. 1979)

1.478* (generator column-GC/ECD, measured range 4–32°C, Stolzenburg & Andren 1983)

$\ln x = -3428/(T/K) - 4.2786$, ΔH_{ss} = 28.5 kJ/mol (regression eq. given by Dickhut et al. 1986, based on exptl data of Stolzenburg & Andren 1983)

$\log x = -1486/(T/K) - 1.850$; ΔH_{ss} = 28.5 kJ/mol (regression eq. given by Doucette & Andren 1988, based on exptl data of Stolzenburg & Andren 1983); or

$S/(\text{mol/L}) = 2.94 \times 10^{-8} \exp(0.041 \cdot t/^\circ\text{C})$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Stolzenburg & Andren 1983)

1.20 (selected, Shiu & Mackay 1986)

1.30, 1.38 (generator column-HPLC/UV, Billington et al. 1988)

0.82, 0.88, 0.84, 0.95 (RP- HPLC-*k'* correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

1.207 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

0.81 (shake flask-LSC, [¹⁴C] 4-monoCB, Eadie et al. 1990)

1.34 (shake flask-GC/ECD, Li et al. 1992; Li & Andren 1994)

1.32 (shake flask-GC/ECD, Li & Doucette 1993)

1.37* ± 0.042 (generator column-GC/ECD, measured range 5–45°C, Shiu et al. 1997)

$\ln x = -5.9137 - 2926.22/(T/K)$, temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

3.23, 3.81 (supercooled liquid: LDV literature-derived value, FAV final-adjusted value, Li et al. 2003)

$\log S_L/(\text{mol m}^{-3}) = -631/(T/K) + 0.35$ (supercooled liquid, linear regression of literature data, Li et al. 2003)

$\log S_L/(\text{mol m}^{-3}) = -963/(T/K) + 1.53$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* (96.4°C, summary of literature data, temp range 96.4–292.9°C, Stull 1947)

1.41 (supercooled liq. P_L , Weast 1972–1973)

$\log (P/\text{mmHg}) = (9.037 \pm 0.635) - (3445 \pm 18)/(T/K)$, temp range: 452–536 K (static method-quartz manometer measurements, Geidarov et al. 1975)

0.61 (Neely 1981, 1983)

0.339*; 0.253 (P_S - Knudsen effusion; P_L -torsion effusion, extrapolated from exptl. derived from Antoine eq., Ferro et al. 1983)

$\log (P_S/\text{kPa}) = - (3849 \pm 200)/(T/K) + (9.44 \pm 0.63)$; temp range 33–73°C (Knudsen effusion data, solid, Ferro et al. 1983)

$\log (P_L/\text{kPa}) = - (3541 \pm 250)/(T/K) + (8.28 \pm 0.55)$; temp range 75–136°C (torsion effusion data, liquid, Ferro et al. 1983)

1.41 (supercooled liquid P_L , converted from literature P_S , Bidleman 1984)

0.951, 0.567 (P_{GC} by GC-RT correlation, different stationary phases, Bidleman 1984)

0.92, 0.942 (supercooled liquid P_L from P_{GC} , GC-RT correlation, different GC columns, Bidleman 1984)

0.175* (gas saturation-GC, measured range 5.2–24.9°C, Burkhard et al. 1984; Burkhard et al. 1985a)

$\log (P_S/\text{Pa}) = -4754.1/(T/K) + 15.188$; temp range: 5.2–24.9°C (gas saturation-GC, Clapeyron eq. Burkhard et al. 1984)

0.0979 (GC-RI correlation, Burkhard et al. 1985a)

0.320 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.907 (supercooled liquid P_L , GC-RT correlation, Foreman & Bidleman 1985)

0.270, 0.90 (selected P_S , supercooled P_L , Shiu & Mackay 1986)

0.593 (P_{GC} by GC-RT correlation, Hinckley et al. 1990)

0.275 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log (P_L/\text{Pa}) = -3488/(T/K) + 11.67$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

0.0677* (20°C, as saturation-GC/ECD, Wania et al. 1994)

$\log (P_S/\text{Pa}) = -4493/(T/K) + 14.15$; temp range: –20 to 30°C (gas saturation-GC, Wania et al. 1994)

0.087–0.339; 0.253–0.942 (quoted literature P_S range; literature P_L range, Delle Site 1997)

$\log P/\text{kPa} = 15.188 - 4751.1/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

0.468, 0.479 (supercooled liquid P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log P_L/\text{Pa} = -3737/(T/K) + 12.21$ (supercooled liquid, linear regression of literature data, Li et al. 2003)

$\log P_L/\text{Pa} = -3627/(T/K) + 11.84$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations):

58.06 (batch stripping, Atlas et al. 1982; Dow Chemical, Neely 1982))

42.56 (calculated-P/C, Shiu & Mackay 1986)

34.14 (batch stripping-GC, Dunnivant et al. 1988; Dunnivant & Elzerman 1988)

24.39 (wetted-wall column-GC, Fendinger & Glotfelty 1990)

23.30 (wetted-wall column-GC, Brunner et al. 1990)

5.84 (11°C, gas stripping-GC/ECD, Bamford et al. 2002)

18.9 (from 11°C exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 56 \pm 27$ kJ/mol, $\Delta S_H = 0.15 \pm 0.10$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

36.3, 23.44 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

$\log [H/(\text{Pa m}^3/\text{mol})] = -2664/(T/K) + 10.31$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.90 (Branson 1977)

4.26 (Sugiura et al. 1978)

4.80 (Hansch & Leo 1979)

4.61 ± 0.1 (shake flask-GC, Bruggeman et al. 1982)

- 4.69 (RP-TLC- k' correlation, Bruggeman et al. 1982)
- 4.34 (HPLC-RT correlation, Woodburn 1982)
- 4.49 (generator column-HPLC, Woodburn et al. 1984)
- 4.34 (HPLC-RT correlation, Woodburn et al. 1984)
- 4.40 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 4.49 (generator column-GC/ECD, Doucette & Andren 1987,1988)
- 4.55, 4.73, 4.64, 4.59 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 4.53, 4.27 (RP-HPLC- k' correlation, different stationary phases, Sherbolm & Eganhouse 1988)
- 4.61 (recommended, Sangster 1989, 1993)
- 4.72 (HPLC- k' correlation, Noegrohati & Hammers 1992)
- 4.37 (generator column-HPLC, Li & Doucette 1993)
- 4.61 (recommended, Hansch et al. 1995)
- 4.49, 4.65 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 7.01* (generator column-GC; measured range – 10 to 30°C, Harner & Mackay 1995)
- $\log K_{OA} = -6.50 + 3962/(T/K)$; temp range –10 to 20°C, (generator column-GC, Harner & Mackay 1995)
- 7.01* (20°C, generator column-GC, measured range –10 to 30°C, Harner & Bidleman 1996)
- $\log K_{OA} = -4.82 + 3470/(T/K)$; temp range –10 to 30°C (generator column-GC, Harner & Bidleman 1996)
- 7.86, 6.99; 6.99 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 7.13 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
- 6.80; 6.93 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)
- 6.82, 6.78 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
- $\log K_{OA} = 3520/(T/K) - 4.97$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$:

- 2.08 (killifish, Goto et al. 1978)
- 2.68 (NAS 1979)
- 2.77 (estimated, fish, flowing water, Kenaga & Goring 1980; Kenaga 1980)
- 2.67 (calculated-solubility, Kenaga 1980)
- 3.88 (fish, normalized, lipid basis, Tadokoro & Tomita 1987)
- 2.77, 4.07 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.52 (calculated, Kenaga 1980)
- 4.43 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 3.90 (soil, calculated-S, Chou & Griffin 1986)
- 4.71 (Great Lake suspended matter, phase partitioning-reversed phase chromatography by Sep Pak, Eadie et al. 1990)
- 4.70 (Green Bay suspended matter, reversed phase separation, Eadie et al. 1992)
- 3.49 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Sorption Partition Coefficient, $\log K_{OM}$:

- 4.02 (Great Lakes DOC, reversed phase separation, Eadie et al. 1990)
- 4.61 (Green Bay DOC, reversed phase separation, Eadie et al. 1992)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

$k = 2.3 \times 10^{-4} \text{ d}^{-1}$ with $t_{1/2} = 8.2 \text{ yr}$ in surface water at 40°N in summer sunlight is (Dulin et al. 1986)
 $t_{1/2} = 45 \text{ d}$ in water (Mansour & Feicht 1994)

$k(\text{calc}) = 13.5 \text{ h}^{-1}$, maximum summer photolysis rate calculated under midday clear skies, experimental $k(\text{exptl}) \sim 1.0 \times 10^{-8} \text{ mol s}^{-1}$, irradiated with a low-pressure mercury lamp (Bunce et al. 1989)

$k = (0.036\text{--}0.045) \text{ min}^{-1}$ with $t_{1/2} = 15\text{--}19 \text{ min}$, $k = (0.048\text{--}0.082) \text{ min}^{-1}$ with $t_{1/2} = 8\text{--}14 \text{ min}$ and $k = (0.13\text{--}0.30) \text{ min}^{-1}$ with $t_{1/2} = 2\text{--}3 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; $k = (0.027\text{--}0.046) \text{ min}^{-1}$ with $t_{1/2} = 15\text{--}26 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ;

$k = (0.022\text{--}0.038) \text{ min}^{-1}$ with $t_{1/2} = 18\text{--}31 \text{ min}$ in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} = (3.9 \pm 0.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $295 \pm 1 \text{ K}$, with an estimated atmospheric lifetime of $\sim 6 \text{ d}$ (relative rate method, Atkinson & Aschmann 1985)

$k_{\text{OH}} = 2.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ to the $\text{C}_6\text{H}_4\text{Cl}$ ring (ring B), $k_{\text{OH}} = 1.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ to ring A, and $k_{\text{OH}} = 3.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (observed ring A + ring B) with a calculated tropospheric lifetime of 5–11 d (Atkinson 1987)

$k_{\text{OH}}(\text{calc}) = (2.8\text{--}5.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{exptl}) = (3.1\text{--}4.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for mono-chlorobiphenyls, the tropospheric lifetime was calculated to be 5–11 d (Atkinson 1987)

$k_{\text{OH}} = 5.28 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (Atkinson 1989)

$k_{\text{OH}}(\text{exptl}) = (2.8\text{--}5.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = (3.2\text{--}4.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, the tropospheric lifetime is calculated to be 2.7–5.1 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: $t_{1/2} = 175 \text{ h}$ biodegradation by bacteria (Wong & Kaiser 1975; quoted, Pal et al. 1980);

within 7 h by *Alcaligenes* sp. strain Y-42 from lake sediments (Furukawa & Matsumura 1976; quoted, Pal et al. 1980)

$k = 38 \text{ yr}^{-1}$ in the water column, and $k = 380 \text{ yr}^{-1}$ in the sediment, pseudo first-order rate constant for microbial degradation (Wong & Kaiser 1975; quoted, Neely 1981)

$k = 3.1 \text{ nmol L}^{-1} \text{ d}^{-1}$ with an initial concentration of 2.9 $\mu\text{mol/L}$, degradation rate in water from Port Valdez (data of Aug. 1977, Reichardt et al. 1981); $t_{1/2} = 2\text{--}5 \text{ d}$, time for 50% degradation of an initial concentration of 1–100 $\mu\text{g L}^{-1}$ by river dieaway test (Bailey et al. 1983)

$k = 2.0 \mu\text{g mL}^{-1} \text{ d}^{-1}$ at 30 $\mu\text{g mL}^{-1}$, under culture conditions include river water as supportive medium and mixed bacteria cultures obtained from river sediments (Kong & Sayler 1983)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 88 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.01 \text{ d}^{-1}$ with $t_{1/2} = 67 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: estimated atmospheric lifetime of $\sim 6 \text{ d}$ due to reaction with the OH radical for a 24-h average OH radical concn of $5 \times 10^5 \text{ cm}^{-3}$ (Atkinson & Aschmann 1985);

calculated tropospheric lifetime of 5–11 d due to calculated rate constant of gas-phase reaction with OH radical for mono-chlorobiphenyls (Atkinson 1987);

photolysis $t_{1/2} \sim 10\text{--}25 \text{ h}$ for noontime summer sunshine, or more realistically, several days (Bunce et al. 1989);

tropospheric lifetime of 3 d calculated based on reaction principally with OH radical and other photochemical reactions (Bunce et al. 1991);

tropospheric lifetime of 2.7–5.1 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for mono-chlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 4.9 \text{ d}$ in Lake Michigan (Neely 1983);

photolysis $t_{1/2} = 8.2 \text{ yr}$ in summer sunlight at 40°L in surface waters (Dulin et al. 1986);

photolysis $t_{1/2}$ = 45 d, sunlight days in water (Mansour & Feicht 1994)
 $t_{1/2}$ = 15–19 min, 8–14 min and 2–3 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 respectively;
 $t_{1/2}$ = 15–26 min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ; $t_{1/2}$ = 18–31 min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:
Sediment:
Soil:
Biota: depuration $t_{1/2}$ = 88 d for high-dose treatment, $t_{1/2}$ = 67 d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.3.1
Reported aqueous solubilities and octanol-air partition coefficients of 4-chlorobiphenyl (PCB-3) at various temperatures

7.1.1.4 2,2'-Dichlorobiphenyl (PCB-4)

Common Name: 2,2'-Dichlorobiphenyl

Synonym: PCB-4, 2,2-dichloro-1,1'-biphenyl

Chemical Name: 2,2'-dichlorobiphenyl

CAS Registry No: 13029-08-8

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

60.5 (Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

312 (calculated, Mackay et al. 1982; Shiu & Mackay 1986)

Density (g/cm^3 at $20^{\circ}C$): 1.0536

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

185.8 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.448 (mp at $60.5^{\circ}C$)

0.442 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.0 (Webb 1970)

0.90 (Hoover 1971)

1.50 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.79 (generator column-GC/ECD, Weil et al. 1974)

0.0212 (shake flask-GC/ECD from Aroclor 1242, Lee et al. 1979)

1.86 ($20^{\circ}C$, supercooled liquid, shake flask-GC/ECD, Chiou et al. 1982,1983; Chiou 1985)

1.124 ($20^{\circ}C$, supercooled liquid, calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.511, 0.322, 0.362, 0.511 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

1.207 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.133 (Knudsen-effusion technique, extrapolated from $37-54.92^{\circ}C$, Smith et al. 1964)

0.36 (quoted, Neely 1981)

0.82 (P_L calculated from P_S using F, Neely 1981)

0.189 (GC-RI correlation, Burkhard et al. 1985a)

0.424 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985a)

0.326, 0.335 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.134 (extrapolated-Antoine eq., solid, Stephenson & Malanowski 1987)

$\log(P_S/kPa) = -5019/(T/K) + 12.962$; temp range $37-55^{\circ}C$ (Antoine eq., Stephenson & Malanowski 1987)

0.152 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.275, 0.363 (supercooled liquid P_L ; GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -3462/T + 11.73$ (supercooled liquid P_L , GC-RT, Falconer & Bidleman 1994)

0.0603–0.315; 0.280–0.424 (quoted literature P_S range; literature P_L range, Delle Site 1997)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated):

30.2 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

34.14 (batch stripping, Dunnivant et al. 1988; Dunnivant & Elzerman 1988)

23.3 (wetted-wall column-GC, Brunner et al. 1990)

- 8.02 (11°C, gas stripping-GC/ECD, Bamford et al. 2002)
 23.0(from 11°C exptl. data and compensation point, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 50 \pm 25$ kJ/mol, $\Delta S_H = 0.13 \pm 0.09$ kJ/mol-K
 (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 4.04 (HPLC-RT correlation, Sugiura et al. 1978)
 5.70 (HPLC-RT correlation, Sugiura et al. 1979)
 5.51 (Hansch & Leo 1979)
 4.00 (HPLC- k' correlation, McDuffie 1981)
 5.00 \pm 0.1 (shake flask-GC, Bruggeman et al. 1982)
 3.02 (RP-TLC-retention correlation, Bruggeman et al. 1982)
 3.55 (HPLC-RT correlation, Woodburn 1982)
 4.80 (shake flask-GC/ECD, Chiou et al. 1983; Chiou 1985; Chiou & Block 1986)
 4.90; 3.55 (generator column-GC/ECD; HPLC-RT correlation, Woodburn et al. 1984)
 3.63; 4.89 (RP-HPLC-RT correlation: uncorrected; with ortho correction, Rapaport & Eisenreich 1984)
 4.90 (generator column-GC/ECD, Doucette & Andren 1987,1988)
 4.25, 4.86, 4.65, 4.94(RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 4.965 \pm 0.013(slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 5.09 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 4.73 (recommended, Sangster 1993)
 4.97 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations:

- 7.18; 6.56 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
 $\log K_{OA} = -4.84 + 3590/(T/K)$ (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
 7.66, 6.86 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 6.29 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 2.04 (killifish, Goto et al. 1978)
 3.72, 2.95, 3.60, 3.26 (golden orfe, carp, brown trout, guppy, Sugiura et al. 1979)
 – 1.40, – 1.30, – 1.35 (adipose tissue of male, female Albino rats, rodents, Geyer et al. 1980)
 2.05, 2.45 (fish: flowing water, microcosm condition Garten & Trabalka 1983)
 3.43, 2.90 (algae, calculated, Geyer et al. 1984)
 3.43, 3.38, 3.80(algae, fish, activated sludge, Freitag et al. 1984,1985)
 3.85 (fish, normalized, lipid basis, Tadokoro & Tomita 1987)
 3.38; 3.413, 3.715(quoted-whole fish, fish lipid; calculated-molecular connectivity indices, K_{OW} , Lu et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 3.68 (Woodburn silt loam soil, soil organic matter, sorption isotherm-GC, Chiou et al. 1983)
 4.76 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 3.84 (soil, calculated-S, Chou & Griffin 1986)
 3.92 (soil, calculated-MCI, Sabljic et al. 1995)
 3.96; 3.92 (soil, calculated-Characteristic Root Index CRI; quoted lit., Saçan & Balcioglu 1996)
 4.30 (soil, calculated- K_{OW} , Girvin & Scott 1997)
 4.90; 3.90 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)

Sorption Partition Coefficient, $\log K_{OM}$ at 25°C or as indicated:

- 3.68 (20°C, Wood burn silt loam soil, 1.9% organic matter, equilibrium sorption isotherm-GC/ECD, Chiou et al. 1983)
 3.68, 4.18 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $t_{1/2} \sim 3.1$ h of evaporation with an initial concentration of 0.1 ppm from 4.5 cm depth of water solution in a glass dish at 24°C is 3.1 h and $t_{1/2} = 0.4$ h with stirring of the solution; the experimental $t_{1/2} = 3.9$ h and 0.9 h of evaporation under same condition with stirring of the solution (Chiou et al. 1979).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)

$k_{OH}(\text{calc}) = (1.4 - 2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the tropospheric lifetime $\tau(\text{calc}) = 8-17$ d for dichlorobiphenyls due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH} = (2.0 \pm 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{O_3} < 2.0 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 297 ± 2 K (relative rate method, Kwok et al. 1995)

tropospheric lifetime $\tau(\text{calc}) = 3.4-7.2$ d, based on the experimentally determined gas-phase reaction $k_{OH}(\text{exptl}) = (2.0 - 4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the calculated $k_{OH}(\text{calc}) = (1.4 - 3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: Biodegraded fairly quickly by *Alcaligenes* sp. strain Y-42 but small residue was detected after 7 h (Furukawa & Matsumura 1976; quoted, Pal et al. 1980);

microbial degradation with pseudo first-order $k = 0.65 \text{ yr}^{-1}$ in the water column and $k = 6.5 \text{ yr}^{-1}$ in the sediment (Furukawa et al. 1978; quoted, Neely 1981).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.027 \text{ d}^{-1}$ (10°C, sandworm, Goerke & Erst 1977; quoted, Waid 1986)

$k_1 = 0.29 \text{ d}^{-1}$, 0.13 d^{-1} , 0.11 d^{-1} , 0.11 d^{-1} (golden orfe, carp, brown trout, guppy, Sugiura et al. 1979)

$k_2 = 0.017 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 122 \text{ d}^{-1}$; $k_2 = 0.014 \text{ d}^{-1}$ (rainbow trout, calculated, Gobas & Mackay 1987)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 183 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 93 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radical for dichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for dichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 34.5$ d in Lake Michigan (Neely 1983)

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 40$ d in rainbow trout, and $t_{1/2} = 20$ d in its muscle (Niimi & Oliver 1983).

Depuration $t_{1/2} = 183$ d for high-dose treatment, $t_{1/2} = 93$ d for high-dose + enzyme treatment (juvenile rainbow trout, Buckman et al. 2004)

7.1.1.5 2,3-Dichlorobiphenyl (PCB-5)

Common Name: 2,3-Dichlorobiphenyl

Synonym: PCB-5, 2,3-dichloro-1,1'-biphenyl

Chemical Name: 2,3-dichlorobiphenyl

CAS Registry No: 16605-91-7

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$): 28.0

27.8–28.2 (Erickson 1985)

Boiling Point ($^{\circ}C$):

172 (at 4000 Pa, Erickson 1986)

Density (g/cm^3):

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.934 (mp at $28^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.70 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

1.31, 1.23, 0.756, 0.829 (quoted lit.; RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

1.00, 0.658 (quoted average of Brodsky & Ballschmiter 1988, calculated-MCI χ , Patil 1991)

1.36 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.147, 0.144, 0.114 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985a)

0.151 (supercooled liquid P_L , GC-RT correlation, Burkhard et al. 1985b)

0.162 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -3769/(T/K) + 11.81$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

19.56 (calculated-P/C, Burkhard et al. 1985b)

28.57 (calculated-MCI χ , Sabljic & Güsten 1989)

23.30 (wetted-wall column-GC, Brunner et al. 1990)

24.19 (calculated-QSPR, Dunnivant et al. 1992)

8.97 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

24.5 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 48 \pm 24\ kJ/mol$, $\Delta S_H = 0.12 \pm 0.08\ kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.20 (RP-TLC-RT correlation, Bruggeman et al. 1982)

4.82, 4.92, 5.17, 5.05 (RP-PLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

4.99 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations:

7.40; 6.98 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)

$\log K_{OA} = -5.41 + 3820/(T/K)$; temp range 10 – $43^{\circ}C$ (fugacity meter, Kömp & McLachlan 1997a)

- 8.55, 7.59 (0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)
 7.08 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF at 25°C or as indicated:

- 3.08 (oyster, Vreeland 1974)
 3.45–4.11 mean 4.11 (rainbow trout, 15°C, steady-state BCF of 7- to 96-d laboratory study, Oliver & Niimi 1985)
 4.41; 4.11 (rainbow trout, 15°C, kinetic BCF k_1/k_2 , steady-state BCF C_F/C_W , Oliver & Niimi 1985)
 4.11, 5.25; 3.388, 3.895 (quoted-whole fish, fish lipid; calculated-molecular connectivity indices, K_{OW} , Lu et al. 1999)
 3.08, 5.33 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.11, 5.20 (rainbow trout: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

- 4.76 (suspended particulate matter, Burkhard 1984)
 5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = (0.031\text{--}0.036) \text{ min}^{-1}$ with $t_{1/2} = 19\text{--}23 \text{ min}$, $k = (0.054\text{--}0.067) \text{ min}^{-1}$ with $t_{1/2} = 10\text{--}13 \text{ min}$ and $k = (0.22\text{--}0.25) \text{ min}^{-1}$ with $t_{1/2} = 3 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; $k = (0.022\text{--}0.028) \text{ min}^{-1}$ with $t_{1/2} = 25\text{--}32 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ; $k = (0.022\text{--}0.024) \text{ min}^{-1}$ with $t_{1/2} = 29\text{--}31 \text{ min}$ in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Hydrolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17 \text{ d}$, based on $k_{OH}(\text{calc.}) = (1.4\text{--}2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)
 $k_{OH}(\text{aq.}) = 7.9 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, 0.1–10 d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)
 tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2 \text{ d}$, based on the experimentally determined gas-phase reaction $k_{OH}(\text{exptl}) = (2.0\text{--}4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the calculated $k_{OH}(\text{calc}) = (1.4\text{--}3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 = 0.011 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)
 $k_1 = 300 \text{ d}^{-1}$; $k_2 = 0.011 \text{ d}^{-1}$ (rainbow trout, Oliver & Niimi 1985)
 $\log 1/k_2 = 2.0, 2.2 \text{ h}$ (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b)

Half-Lives in the Environment:

- Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radical for dichlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for dichlorobiphenyls (Kwok et al. 1995).
 Surface water: $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991);

$t_{1/2}$ = 19–23 min, 10–13 min and 3 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively;
 $t_{1/2}$ = 16–26 min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ;
 $t_{1/2}$ = 29–31 min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2}$ = 61 d in rainbow trout (Niimi & Oliver 1983; Oliver & Niimi 1985), and $t_{1/2}$ = 26 d in its muscle (Niimi & Oliver 1983).

7.1.1.6 2,3'-Dichlorobiphenyl (PCB-6)

Common Name: 2,3'-Dichlorobiphenyl

Synonym: PCB-6

Chemical Name: 2,3'-dichlorobiphenyl

CAS Registry No: 25569-80-6

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

36 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.605 (supercooled liquid S_L , Burkhard et al. 1985a)

0.580 ($20^{\circ}C$, supercooled liquid S_L , Murphy et al. 1987)

1.226 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.928 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.165 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.157, 0.169, 0.0754 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.173, 1.208 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0799 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.141, 0.178 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -3769/(T/K) + 11.88$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

27.76 (calculated-P/C, Burkhard et al. 1985a)

30.0 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

39.42 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

25.33 (wetted-wall column-GC, Brunner et al. 1990)

33.09 (calculated-QSPR, Dunnivant et al. 1992)

4.016, 11.74 (0, $15^{\circ}C$, from modified two-film exchange model, Hornbuckle et al. 1994)

9.14 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

24.8 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 47 \pm 24$ kJ/mol, $\Delta S_H = 0.12 \pm 0.08$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.03 (calculated-TSA, Burkhard 1984)

5.02 (quoted and selected, Brownwell & Farrington 1985)

4.84 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.83 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

Environmental Fate Rate Constants, k , or Half Lives, $t_{1/2}$:

Volatilization:

Photolysis: calculated sunlight $k < 2 \times 10^{-8} \text{ s}^{-1}$ and $5.7 \times 10^{-11} \text{ s}^{-1}$, with $t_{1/2} > 400 \text{ d}$ at 40°N latitude in winter (Dulin et al. 1986);

$k = (0.30\text{--}0.036) \text{ min}^{-1}$ with $t_{1/2} = 19\text{--}23 \text{ min}$, $k = (0.054\text{--}0.067) \text{ min}^{-1}$ with $t_{1/2} = 10\text{--}13 \text{ min}$ and $k = (0.13\text{--}0.21) \text{ min}^{-1}$ with $t_{1/2} = 3\text{--}5 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; rate constants $k = (0.015\text{--}0.043) \text{ min}^{-1}$ with $t_{1/2} = 36\text{--}29 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ; rate constants $k = (0.018\text{--}0.022) \text{ min}^{-1}$ with $t_{1/2} = 31\text{--}38 \text{ min}$ in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)

tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17 \text{ d}$ for dichlorobiphenyls, based on $k_{OH}(\text{calc.}) = (1.4\text{--}2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 7.1 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, 0.1–10d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2 \text{ d}$ for dichlorobiphenyls, based on the experimentally determined gas-phase reaction $k_{OH}(\text{exptl}) = (2.0\text{--}4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the $k_{OH}(\text{calc}) = (1.4\text{--}3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: biodegraded fairly quickly by *Alcaligenes* sp. strain Y-42 from lake sediments but small amount residue was detected after 7 h (Furukawa & Matsumura 1976; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 192 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 149 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radical for dichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for dichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines for $\text{OH}\cdot$ oxidation (Sedlak & Andren 1991);
 $t_{1/2} = 19\text{--}23$ min, $10\text{--}13$ min and $3\text{--}5$ min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 respectively;
 $t_{1/2} = 36\text{--}29$ min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ;
 $t_{1/2} = 31\text{--}38$ min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 192$ d for high-dose treatment, $t_{1/2} = 149$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.8 2,4'-Dichlorobiphenyl (PCB-8)

Common Name: 2,4'-Dichlorobiphenyl

Synonym: PCB-8, 2,4'-dichloro-1,1'-biphenyl

Chemical Name: 2,4'-dichlorobiphenyl

CAS Registry No: 34883-43-7

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

46 (Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.0536

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

185.8 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

0.66 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.50 (Webb 1970; Hoover 1971)

1.88 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.637 (shake flask-GC, Haque & Schmedding 1975)

0.620 (generator column-GC/ECD, Weil et al. 1974)

0.139 (shake flask-GC/ECD from Aroclor 1242 mixture, Lee et al. 1979)

1.17 ($20^{\circ}C$, supercooled liquid P_L , shake flask-GC/ECD, Chiou et al. 1983; Chiou 1985)

0.974, 0.848, 0.643, 0.658 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

1.58, 1.45 (supercooled liquid S_L : derivation of literature-derived value, final-adjusted value, Li et al. 2003)

$\log S_L/(mol m^{-3}) = -1000/(T/K) + 1.17$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0998 (GC-RI correlation, Burkhard et al. 1985a)

0.147 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.157, 0.143 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log (P/mmHg) = 9.74 - 3840/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.129, 0.158 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -3769/(T/K) + 11.84$ (GC-RT correlation, Falconer & Bidleman 1994)

0.123, 0.148 (supercooled liquid P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log P_L/Pa = -3818/(T/K) + 11.90$ (supercooled liquid, linear regression of literature data, Li et al. 2003)

$\log P_L/Pa = -3728/(T/K) + 11.68$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

96.7 (gas stripping-GC, Atlas et al. 1982)

23.30 (wetted wall column-GC/ECD, Brunner et al. 1990)

35.67 ± 2.7 (gas stripping-GC/ECD; Girvin et al. 1997)

6.01, 9.87, 15.85, $24.89^* \pm 0.29$, 36.07 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 13.2307 - 5304.31/(T/K)$; temp range $4-31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(44.1/kJ \cdot mol^{-1})/RT] + (0.110/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: $4-31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

25.7 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 44 \pm 3$ kJ/mol, $\Delta S_H = 0.11 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

26.3, 22.9 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

$\log H/(\text{Pa m}^3/\text{mol}) = -2428/(T/K) + 9.56$ (LDV linear regression of literature data, Li et al. 2003)

$\log H/(\text{Pa m}^3/\text{mol}) = -2728/(T/K) + 10.51$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.51 (Hansch & Leo 1979)

4.48 (HPLC-RT correlation, Woodburn 1982)

5.10 (shake flask-GC, Chiou et al. 1983; Chiou 1985; Chiou & Block 1986)

5.10 \pm 0.4 (selected, Shiu & Mackay 1986)

5.14 (generator column-GC/ECD, Woodburn et al. 1984)

4.47; 5.10 (RP-HPLC-RT correlation: uncorrected; with ortho correction, Rapaport & Eisenreich 1984)

5.14 (generator column-GC/ECD, Doucette & Andren 1987,1988)

4.93, 5.05, 5.24, 5.15 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

5.13 (HPLC- k' correlation, Noegrohati & Hammers 1992)

5.27 (average value, generator column-GC, Larsen et al. 1992)

5.09 (recommended, Sangster 1993)

5.10 (recommended, Hansch et al. 1995)

5.09, 5.12 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ as or as indicated and reported temperature dependence equations:

7.40 (fugacity meter/generator column-GC; Kömp & McLachlan 1997a)

$\log K_{OA} = -5.41 + 3820/(T/K)$ (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)

8.58, 7.61 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)

7.13 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

7.40, 7.34 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log K_{OA} = 3785/(T/K) - 5.35$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$:

3.83, 3.55, 3.99 (algae, fish, act. sludge, Freitag et al. 1984,1985)

2.60–4.08 (various marine species, mean dry wt. BCF, Hope et al. 1998)

4.12–5.33 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)

3.83, 4.53 (algae: wet wt basis, dry wt basis, Geyer et al. 2000)

3.57, 5.76 (*Daphnia*: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

3.90 (soil/sediment, sorption isotherm, Haque & Schmedding 1976)

4.16 (Woodburn silt loam soil, equilibrium sorption isotherm-GC/ECD, Chiou et al. 1983)

4.83 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

5.90 (Lake Michigan water column, Swackhamer & Armstrong 1987)

5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

3.99; 4.13 (soil, calculated-Characteristic Root Index CRI; quoted lit., Saçan & Balcioglu 1996)

4.54–4.56 (Catlin silt loam, $f_{OC} = 0.0226$, depth 0–15 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.65–4.70 (Cloudland loam, $f_{OC} = 0.0024$, depth 15–30 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.61 (Kenoma silt loam, $f_{OC} = 0.0153$, depth 0–20 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.38–4.39 (Kenoma silt loam, $f_{OC} = 0.0092$, depth 58–82 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.57–4.73 (Kenoma silt loam, $f_{OC} = 0.002$, depth 120–155 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.52–4.54 (Norborne silt loam, $f_{OC} = 0.0137$, depth 0–20 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.54–4.57 (Norborne silt loam, $f_{OC} = 0.009$, depth 33–65 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.53–4.66 (Norborne silt loam, $f_{OC} = 0.0057$, depth 65–85 cm, batch equilibrium-GC, Girvin & Scott 1997)

4.23–4.53; 3.90–5.90 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)

4.23; 3.93, 4.53, 4.46 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Sorption Partition Coefficient, $\log K_{OM}$:

3.89 (soil organic matter, equilibrium sorption isotherm-GC/ECD, Chiou et al. 1983)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: depletion rate constant $k = 45 \text{ d}^{-1}$ from aqueous solution in a 26-cm or 67-cm purge vessel, (Girvin et al. 1997).

Photolysis: photolysis rate $k_p(\text{exptl}) < 2 \times 10^{-8} \text{ d}^{-1}$ with $t_{1/2} > 400 \text{ d}$; $k_p(\text{calc}) < 2 \times 10^{-8} \text{ d}^{-1}$ in winter sunlight at 40°L in surface waters (Dulin et al. 1986)

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)

tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17 \text{ d}$ for dichlorobiphenyls, based on $k_{OH}(\text{calc.}) = (1.4 - 2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)

tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2 \text{ d}$ for dichlorobiphenyls, based on the experimentally determined gas-phase reaction $k_{OH}(\text{exptl}) = (2.0 - 4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the $k_{OH}(\text{calc}) = (1.4 - 3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Sorption-Desorption Rate Constants:

$k_2 = 0.006 \text{ d}^{-1}$ with $t_{1/2} = 109 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 104 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radical for dichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for dichlorobiphenyls (Kwok et al. 1995).

Surface water: photolysis $t_{1/2} > 400 \text{ d}$ in winter sunlight at 40°L in surface waters (Dulin et al. 1986)

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 109 \text{ d}$ for high-dose treatment, $t_{1/2} = 104 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.9 2,5-Dichlorobiphenyl (PCB-9)

Common Name: 2,5-Dichlorobiphenyl

Synonym: PCB-9, 2,5-dichloro-1,1'-biphenyl

Chemical Name: 2,5-dichlorobiphenyl

CAS Registry No: 34883-39-1

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

22–23 (Weingarten 1962)

Boiling Point ($^{\circ}C$):

171 (15mm Hg, Erickson 1986))

Density (g/cm^3 at $20^{\circ}C$): 1.0536

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F:

1.0 (calculated, assuming $\Delta S_{fus} = 56$ J/mol K, Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.58 (generator column-GC/ECD, Weil et al. 1974)

2.028 (shake flask-GC, Chiou et al. 1977)

0.190 (generator column-GC/ECD, Bruggeman et al. 1981)

1.940 (generator column-GC/ECD, Miller et al. 1984; 1985)

0.0739, 0.0739, 0.0722, 0.07055 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

1.115 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0775 (Augood et al. 1953)

0.184 (supercooled liquid P_L , Yalkowsky et al. 1983)

0.184 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

0.202 (GC-RI correlation, Burkhard et al. 1985a)

0.198 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.231, 0.232 (supercooled P_L , GC-RT correlation, different GC stationary phases, Foreman & Bidleman 1985)

0.180 (selected, Shiu & Mackay 1986)

0.204 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -3862/(T/K) + 12.22$, (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.105–0.232 (quoted lit. P_L range, Delle Site 1997)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated and reported temperature dependence equations)

39.31 (batch stripping-GC/ECD, Dunnivant et al. 1988; Dunnivant & Elzerman 1988)

28.37 (wetted wall column-GC/ECD, Brunner et al. 1990)

16.1, 29.6, 58.2, 82.2, 123, 165.4 (10.4, 20, 30.1, 34.9, 42.1, $47.9^{\circ}C$, gas stripping-HPLC/fluorescence, ten Hulscher et al. 1992)

30.95 ($20^{\circ}C$, selected from reported experimentally measured values, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 6.055 - 2331/(T/K)$, (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

- 29.0 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 41 \pm 4$ kJ/mol, $\Delta S_H = 0.10 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, log K_{OW} :

- 5.18 (RP-TLC- k' correlation, Bruggeman et al. 1982; Bruggeman et al. 1984)
 5.16 (generator column-GC/ECD, Miller et al. 1984,1985)
 5.03 (calculated-TSA, Burkhard 1984)
 4.67; 5.30 (RP-HPLC-RT correlation: uncorrected; with ortho correction, Rapaport & Eisenreich 1984)
 5.01, 5.10, 5.19, 5.10 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.13 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 5.10 (recommended, Sangster 1993)
 5.16 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated:

- 8.37, 7.40; 7.33(0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 7.16 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 5.68 (goldfish, 3% lipid by wt., static fish-water equilibration system, 23-d exposure, Bruggeman et al. 1981)
 5.45 (goldfish, 10% lipid dry wt. in food, Bruggeman et al. 1981)
 5.72 (guppy, 3.5% lipid by wt., Bruggeman et al. 1982,1984)
 4.14; 3.90 (goldfish, exptl.; correlated, Mackay & Hughes 1984)
 3.38–4.11 mean 4.00 (rainbow trout, 15°C, steady-state BCF, 7- to 96-d study, Oliver & Niimi 1985)
 4.0 (rainbow trout, mean of 7–96 d exposure, Oliver & Niimi 1985)
 4.53, 4.00 (rainbow trout: kinetic BCF; steady state BCF, Oliver & Niimi 1985)
 4.26 (guppy, Gobas et al. 1987)
 5.68 (goldfish, Noegrohati & Hammers 1992)
 3.89; 3.42 (zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
 4.0, 5.09 (rainbow trout, flow through 96-d: wet wt basis, lipid wt basis, Geyer et al. 2000)
 3.89, 5.43 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.00; 4.13 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 4.83 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.01 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constants $k = (0.024\text{--}0.038)$ min⁻¹ with $t_{1/2} = 18\text{--}29$ min, $k = (0.033\text{--}0.048)$ min⁻¹ with $t_{1/2} = 14\text{--}21$ min and $k = (0.13\text{--}0.14)$ min⁻¹ with $t_{1/2} = 5$ min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 µg/mL TiO₂, respectively; rate constant $k = (0.056\text{--}0.064)$ min⁻¹ with $t_{1/2} = 11\text{--}12$ min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 µg/mL TiO₂; rate constant $k = (0.015\text{--}0.027)$ min⁻¹ with $t_{1/2} = 26\text{--}47$ min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 µg/mL TiO₂ (Huang et al. 1996)

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = 1.8 \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ at room temp. (SAR, Atkinson 1987)

tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17$ d for dichlorobiphenyls, based on $k_{\text{OH}}(\text{calc.}) = (1.4 - 2.9) \times 10^{-12}$ $\text{cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)

tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2$ d for dichlorobiphenyls, based on the experimentally determined gas-phase reaction $k_{\text{OH}}(\text{exptl}) = (2.0 - 4.2) \times 10^{-12}$ $\text{cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the $k_{\text{OH}}(\text{calc}) = (1.4 - 3.1) \times 10^{-12}$ $\text{cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 95% degradation at 24 h in one of the defined PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 920 \text{ d}^{-1}$; $k_2 = 0.066 \text{ d}^{-1}$ (23°C, goldfish, 3% lipid, Bruggeman et al. 1981; quoted, Waid 1986)

$k_2 = 0.008 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 190 \text{ d}^{-1}$; $k_2 = 0.11 \text{ d}^{-1}$ (guppy, Bruggeman et al. 1984; quoted, Clark et al. 1990)

$k_2 = 0.066, 0.0523 \text{ d}^{-1}$ (goldfish, exptl., calculated, Mackay & Hughes 1984)

$k_1 = 280 \text{ d}^{-1}$; $k_2 = 0.0082 \text{ d}^{-1}$ (rainbow trout, Oliver & Niimi 1985)

$k_1 = 38.3, 49.2 \text{ h}^{-1}$; $1/k_2 = 360, 220 \text{ h}$ (goldfish, guppy, quoted, Hawker & Connell 1985)

$k_1 = 1200 \text{ d}^{-1}$ (guppy, Opperhuizen 1986)

$k_1 = 122 \text{ d}^{-1}$; $k_2 = 0.0089 \text{ d}^{-1}$ (rainbow trout, calculated, Gobas & Mackay 1987)

$\log k_1 = 2.96, 3.07 \text{ d}^{-1}$; $\log 1/k_2 = 0.96, 1.18 \text{ d}$ (fish, quoted, Connell & Hawker 1988)

$\log 1/k_2 = 2.1, 2.3 \text{ h}$ (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b)

$\log k_2 = -0.96, -1.17 \text{ d}^{-1}$ (fish, quoted, Thomann 1989)

$k_1 = 2760 \text{ d}^{-1}$; $k_2 = 0.368 \text{ d}^{-1}$ (zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 192 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 149 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radicals for dichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radicals for dichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 18\text{--}29$ min, 14–21 min and 5 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; $t_{1/2} = 11\text{--}12$ min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ; $t_{1/2} = 26\text{--}47$ min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: clearance $t_{1/2} = 10$ d in goldfish (Bruggeman et al. 1981)

$t_{1/2} = 6.5$ d in guppy (Bruggeman et al. 1984);

$t_{1/2} = 85$ d in rainbow trout (Niimi & Oliver 1983; Oliver & Niimi 1985), and its muscle, $t_{1/2} = 56$ d (Niimi & Oliver 1983).

depuration $t_{1/2} = 192$ d for high-dose treatment, $t_{1/2} = 149$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.10 2,6-Dichlorobiphenyl (PCB-10)

Common Name: 2,6-Dichlorobiphenyl

Synonym: PCB-10, 2,6-dichloro-1,1'-biphenyl

Chemical Name: 2,6-dichlorobiphenyl

CAS Registry No: 33146-45-1

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

35.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

185.8 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.6 (differential scanning calorimetry, Miller et al. 1984)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

41.0 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.789 (mp at $35.5^{\circ}C$)

0.801 Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.452 (shake flask-GC, Chiou et al. 1977)

1.390 (generator column-GC/ECD, Miller et al. 1984,1985)

0.294, 0.435, 0.245, 0.406 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

2.41 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

0.540 (generator column-GC/ECD, Opperhuizen et al. 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.288 (GC-RI correlation, Burkhard et al. 1985a)

0.365 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.336, 0.371 (supercooled P_L , GC-RT correlation, different GC stationary phases, Foreman & Bidleman 1985)

0.347 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -3642/(T/K) + 11.74$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

47.83 (calculated-P/C, Burkhard et al. 1985b)

47.61 (calculated-MCI χ , Sabljic & Güsten 1989)

23.30 (wetted wall column-GC, Brunner et al. 1990)

42.86 (calculated-QSPR, Dunnivant et al. 1992)

27.3 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 42 \pm 6\ kJ/mol$, $\Delta S_H = 0.10 \pm 0.01\ kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 5.30 (quoted, Kaiser 1983)
- 4.96 (calculated-TSA, Burkhard 1984)
- 5.31 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 4.93 (generator column-GC/ECD, Miller et al. 1984,1985)
- 4.97, 5.00, 4.97, 5.01 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 4.982 \pm 0.013 (shake flask/slow stripping-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
- 4.99 (recommended, Sangster 1993)
- 4.98 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations:

- 7.18 (fugacity meter/generator column-GC; Kömp & McLachlan 1997a)
- $\log K_{OA} = -4.84 + 3590/(T/K)$ (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
- 6.18 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:Sorption Partition Coefficient, $\log K_{OC}$:

- 4.76 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 3.99 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $k = 0.043 \text{ min}^{-1}$ with $t_{1/2} = 16 \text{ min}$, $k = 0.082 \text{ min}^{-1}$ with $t_{1/2} = 8 \text{ min}$ and $k = 0.30 \text{ min}^{-1}$ with $t_{1/2} = 2 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; rate constants $k = 0.034 \text{ min}^{-1}$ with $t_{1/2} = 20 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB are: irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ; rate constants $k = 0.052 \text{ min}^{-1}$ with $t_{1/2} = 13 \text{ min}$ in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17 \text{ d}$ for dichlorobiphenyls, based on $k_{OH}(\text{calc.}) = (1.4\text{--}2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2 \text{ d}$ for dichlorobiphenyls, based on the experimentally determined gas-phase reaction $k_{OH}(\text{exptl}) = (2.0\text{--}4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the $k_{OH}(\text{calc}) = (1.4\text{--}3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 50% degradation at 72 h in one of the PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 183 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
- $k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 93 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radicals for dichlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radicals for dichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2}$ = 16 min, 8 min and 2 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; $t_{1/2}$ = 20 min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB are irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 ; $t_{1/2}$ = 13 min in St. Lawrence River water containing 3 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2}$ = 56 d for high-dose treatment, $t_{1/2}$ = 53 d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.11 3,3'-Dichlorobiphenyl (PCB-11)

Common Name: 3,3'-Dichlorobiphenyl

Synonym: PCB-11, 3,3'-dichloro-1,1'-biphenyl

Chemical Name: 3,3'-dichlorobiphenyl

CAS Registry No: 2050-67-1

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

29 (Weast 1972–73, 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

320 (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

185.8 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.912 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.057 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

0.0406, 0.102, 0.093, 0.0974 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.354 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0267 (P_s from GC-RT correlation, Westcott & Bidleman 1981; Westcott et al. 1981)

0.0865, 0.0952 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Bidleman 1984)

0.0645 (supercooled liquid P_L , GC-RT correlation, Burkhard 1984)

Biota: $t_{1/2} = 5 \text{ d}$ in rainbow trout, and $t_{1/2} < 5 \text{ d}$ in its muscle (Niimi & Oliver 1983)

7.1.1.12 3,4-Dichlorobiphenyl (PCB-12)

Common Name: 3,4-Dichlorobiphenyl

Synonym: PCB-12, 3,4-dichloro-1,1'-biphenyl

Chemical Name: 3,4-dichlorobiphenyl

CAS Registry No: 2974-92-7

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

49–50 (Weingarten 1961)

Boiling Point ($^{\circ}C$):

195–200 (Weast 1972–73)

Density (g/cm^3):

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

185.8 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.566 (calculated, Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.233 (calculated-TSA, supercooled liquid P_L , Burkhard et al. 1985b)

0.0523, 0.112, 0.0888, 0.128 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00791 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

0.0138 (supercooled liquid P_L , calculated-mp, Dunnivant & Elzerman 1988)

0.280 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.091; 0.658 (quoted average of Brodsky & Ballschmiter 1988; calculated- χ , Patil 1991)

0.4004 (calculated-QSPR, Dunnivant et al. 1992)

0.930 (calculated-group contribution, Kühne et al. 1995)

0.268, 0.722 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

2.373 (calculated-mp and K_{ow} , Ran et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0532 (supercooled liquid P_L , GT-RT correlation, Burkhard 1984)

0.0313 (GC-RI correlation, Burkhard et al. 1985a)

0.0532 (supercooled liquid P_L , GC-RT correlation, Burkhard et al. 1985b)

0.078, 0.062 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.741 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -3885/(T/K) + 11.92$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.000736–0.0888; 0.0128–0.0783 (literature P_s range; literature P_L range, Delle Site 1997)

0.259 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index [CRI], Saçan & Balcioğlu 1998)

20.3 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 54 \pm 3$ kJ/mol, $\Delta S_H = 0.14 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Henry's Law Constant (Pa m³/mol at 25°C):

- 20.77 (batch stripping/GC/ECD, Dunnivant et al. 1988; Dunnivant & Elzerman 1988)
 14.18 (wetted-wall column-GC, Brunner et al. 1990)

Octanol/Water Partition Coefficient, log K_{OW}:

- 5.51 (Hansch & Leo 1979)
 5.10, 5.51 (HPLC-RT correlation, calculated- π , Woodburn 1982; Woodburn et al. 1984)
 5.29 (generator column-GC, Woodburn et al. 1984)
 5.29 (generator column-GC/ECD, Doucette & Andren 1987)
 5.26, 5.39, 5.22, 5.18 (RP-HPLC-k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.12 (HPLC-k' correlation, Noegrohati & Hammers 1992)
 5.29 (recommended, Sangster 1993)
 5.29 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated:

- 8.71, 7.80; 8.06(0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
 8.02 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC}:

- 4.85 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)
 3.98 (soil, calculated-Characteristic Root Index [CRI], Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis: rate constants $k = (0.019\text{--}0.034) \text{ min}^{-1}$ with $t_{1/2} = 21\text{--}36 \text{ min}$, $k = (0.041\text{--}0.064) \text{ min}^{-1}$ with $t_{1/2} = 11\text{--}17 \text{ min}$ and $k = (0.12\text{--}0.16) \text{ min}^{-1}$ with $t_{1/2} = 4\text{--}6 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO₂, respectively; rate constants $k = (0.013\text{--}0.029) \text{ min}^{-1}$ with $t_{1/2} = 26\text{--}52 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB are irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO₂ (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures see reference:
 $k_{\text{OH}}(\text{calc}) = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17 \text{ d}$ for dichlorobiphenyls, based on $k_{\text{OH}}(\text{calc.}) = (1.4\text{--}2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2 \text{ d}$ for dichlorobiphenyls, based on the experimentally determined gas-phase reaction $k_{\text{OH}}(\text{exptl}) = (2.0\text{--}4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the calculated $k_{\text{OH}}(\text{calc}) = (1.4\text{--}3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 100% degraded by Nocardia strain NCIB 10603 within one week (Baxter et al. 1975; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 88 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.010 \text{ d}^{-1}$ with $t_{1/2} = 67 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radical for dichlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 3.4–7.2 d based on the

experimentally determined rate constant for gas-phase reaction with OH radical for dichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2}$ = 21–36 min, 11–17 min and 4–6 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; $t_{1/2}$ = 26–52 min in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB are irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2}$ = 88 d for high-dose treatment, $t_{1/2}$ = 67 d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.13 3,4'-Dichlorobiphenyl (PCB-13)

Common Name: 3,4'-Dichlorobiphenyl

Synonym: PCB-13, 3,4'-dichloro-1,1'-biphenyl

Chemical Name: 3,4'-dichlorobiphenyl

CAS Registry No: 2974-90-5

Molecular Formula: $C_{12}H_8Cl_2$

Molecular Weight: 233.1

Melting Point ($^{\circ}C$):

51 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.084 (supercooled liquid S_L , Burkhard et al. 1985a)

0.093 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.369 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0572 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0595 (GC-RI correlation, Burkhard et al. 1985b)

0.083, 0.067 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -3885/(T/K) + 11.92$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa\cdot m^3/mol$):

12.36 (calculated-P/C, Burkhard et al. 1985b)

31.92 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

25.75 (calculated-QSPR, Dunnivant et al. 1992)

49.63 (calculated-QSPR, Achman et al. 1993)

7.44 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

21.9 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 51 \pm 25\ kJ/mol$, $\Delta S_H = 0.13 \pm 0.09\ kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.10 (calculated-TSA, Burkhard 1984)

5.15 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

5.29 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

5.15 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.98 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

4.90 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

 $\log (P_L/\text{Pa}) = -3971/(T/\text{K}) + 12.18$; (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)
 0.00197* (gas saturation-GC/ECD, Wania et al. 1994)
 $\log (P_s/\text{Pa}) = -4977/(T/\text{K}) + 14.10$; temp range –20 to 30°C (gas saturation-GC, solid, Wania et al. 1994)
 0.0426 (supercooled liquid P_L , 20°C, from Falconer & Bidleman, Harner & Bidleman 1996)
 0.00313–0.0219; 0.018–0.0837 (literature P_s range; literature P_L range, Delle Site 1997)
 0.223; 0.084 (P_L , calculated-MCI χ and Characteristic Root Index [CRI]; quoted lit., Saçan & Balcioglu 1998)
 $\log P/\text{Pa} = 14.10 - 4977/(T/\text{K})$ temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
 0.0589, 0.0575 (supercooled liquid P_L ; LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log P_L/\text{Pa} = -3931/(T/\text{K}) + 11.89$ (supercooled liquid, LDV linear regression of literature data, Li et al. 2003)
 $\log P_L/\text{Pa} = -3829/(T/\text{K}) + 11.60$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

30.4 (calculated-P/C, Murphy et al. 1983)
 11.04 (calculated-P/C, Burkhard et al. 1985b)
 14.69 (calculated, Coates & Elzerman 1986)
 17.0 (calculated-P/C, Shiu & Mackay 1986)
 20.16 (batch stripping-GC/ECD, Dunnivant & Elzerman 1988)
 9.66 (wetted-wall column-GC/ECD, Fendinger & Glotfelty 1990)
 18.95; 22.70 (quoted exptl.; calculated-QSPR, Dunnivant et al. 1992)
 20.3 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 54 \pm 3 \text{ kJ/mol}$, $\Delta S_H = 0.14 \pm 0.01 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004
 14.12, 13.49 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)
 $\log [H/(\text{Pa m}^3/\text{mol})] = -2921/(T/\text{K}) + 10.92$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.58 (shake flask-GC, Chiou et al. 1977)
 5.17 (HPLC-RT correlation, Sugiura et al. 1978)
 5.51 (Hansch & Leo 1979)
 5.50 (shake flask-GC, Platford 1982)
 5.36 \pm 0.1; 5.28 (shake flask-GC; RP-TLC- k' correlation, Bruggeman et al. 1982)
 4.92 (HPLC-RT correlation, Woodburn 1982; Woodburn et al. 1984)
 5.33 (generator column-GC/ECD; Woodburn et al. 1984)
 4.82 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
 5.30 (selected, Shiu & Mackay 1986)
 5.33 (generator column-GC/ECD, Doucette & Andren 1987)
 5.03, 5.39, 5.22, 5.28 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.17 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 5.23 (recommended, Sangster 1993)
 5.58 (recommended, Hansch et al. 1995)
 5.35, 5.36 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

7.67* (generator column-GC, measured range –10 to 20°C, Harner & Mackay 1995)
 $\log K_{OA} = -5.10 + 3791.7/(T/\text{K})$, temp range: –10 to 20°C (generator column-GC, Harner & Mackay 1995)
 7.88 (20°C, generator column-GC, Harner & Bidleman 1996)
 $\log K_{OA} = -5.06 + 3792/(T/\text{K})$; (temp range –10 to +20°C, Harner & Bidleman 1996)
 8.87, 7.88; 7.89 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)

8.12 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
 7.73; 7.77 (calibrated GC-RT correlation, GC-RT correlation, Wania et al. 2002)
 7.65, 7.85 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log K_{OA} = 4078/(T/K) - 5.83$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, log BCF:

2.97 (killifish, Goto et al. 1978)
 2.33 (fish, flowing water, Kenaga & Goring 1980; Kenaga 1980)
 3.47 (calculated-S, Kenaga 1980)
 3.58 (rainbow trout, highest value-non-equilibrated, Oliver & Niimi 1984)
 4.27 (*pecea omorika*, Reischl et al. 1989 from Reischl 1988)
 4.06, 5.36 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

4.30 (calculated-solubility, Kenaga 1980)
 4.91 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.65 (EPA-B2 river sediment, Coates & Elzerman 1986)
 4.03 (soil, calculated-Characteristic Root Index [CRI], Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization: estimated evaporation $t_{1/2} = 4.5$ h for an initial concentration of 0.03 ppm in a 4.5 cm depth of water solution in a glass dish and $t_{1/2} = 1.7$ h with stirring of the solution; while experimental observed $t_{1/2} = 4.0$ h and 1.5 h under the same condition with stirring of the solution (Chiou et al. 1979).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 8\text{--}17$ d for dichlorobiphenyls, based on $k_{OH}(\text{calc.}) = (1.4 - 2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for dichlorobiphenyls at room temp. (Atkinson 1987)
 tropospheric lifetime $\tau(\text{calc}) = 3.4\text{--}7.2$ d for dichlorobiphenyls, based on the experimentally determined gas-phase reaction $k_{OH}(\text{exptl}) = (2.0 - 4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and the calculated $k_{OH}(\text{calc}) = (1.4 - 3.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 50–80% biodegraded by *Alcaligenes* sp. strain Y-42 from lake sediments within 7-h period (Furukawa & Matsumura 1976; quoted, Pal et al. 1980);
 $t_{1/2} = 72$ h for 50% degradation in one of the defined PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, and 55% degradation at 24 h in another PCB mixture by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986);
 aerobic biodegradation $t_{1/2} = 1.42$ d without the addition of polymer chitin, $t_{1/2} = 0.98$ d with chitin and $t_{1/2} = 0.46$ d with chitin plus adapted microbes in flow microcosm systems with water and sedimentary materials from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.009 \text{ d}^{-1}$ with $t_{1/2} = 81$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 99$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radical for dichlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 3.4–7.2 d based on the experimentally determined rate constant for gas-phase reaction with OH radical for dichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 57.5$ d in Lake Michigan, 57.5 d (Neely 1983);

aerobic biodegradation $t_{1/2} = 1.42$ d without the addition of polymer chitin, $t_{1/2} = 0.98$ d with chitin and $t_{1/2} = 0.46$ d with chitin plus adapted microbes in flow microcosm systems with water and sedimentary materials from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990).

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 27$ d in *Picea omorika* (Reischl et al. 1989).

depuration $t_{1/2} = 81$ d for high-dose treatment, $t_{1/2} = 99$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.15.1

Reported aqueous solubilities, vapor pressure and octanol-air partition coefficients of 4,4'-dichlorobiphenyl (PCB-15) at various temperatures

Aqueous solubility		Vapor pressure				log K_{OA}	
Shiu et al. 1997		Smith et al. 1964		Wania et al. 1994		Harner & Mackay 1995	
generator column-GC/ECD		Knudsen effusion		gas saturation-GC/ECD		generator column-GC	
t/°C	S/g·m ⁻³	t/°C	P/Pa	t/°C	P/Pa	t/°C	log K_{OA}
5	0.021	29.88	0.149	-10	1.206×10^{-5}	-10	9.36
15	0.0346	29.88	0.152	0	8.303×10^{-5}	0	8.83
25	0.0570	66.58	0.504	10	4.159×10^{-4}	10	8.35
35	0.106	66.58	0.432	20	1.197×10^{-3}	20	7.88
45	0.186	76.78	1.26	30	4.475×10^{-3}	25	7.67
		76.78	1.27				
		87.0	3.55	log P/Pa = A - B/(T/K)		$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 72.6$	
$\Delta H_{sol}/(\text{kJ mol}^{-1}) = 40.2$ at 5–45°C		87.0	3.57	A	14.10	log $K_{OA} = A + B/T$	
				B	4977	A	-5.1
		log P/mmHg = A - B/(T/K)		temp range -10 to 30°C		B	3791.7
		A	13.460	$\Delta H_{subl}/(\text{kJ mol}^{-1}) = 95.3$			
		B	5416				

FIGURE 7.1.15.1 Logarithm of mole fraction solubility, vapor pressure and K_{OA} versus reciprocal temperature for 4,4'-dichlorobiphenyl (PCB-15).

7.1.1.16 2,2',3-Trichlorobiphenyl (PCB-16)

Common Name: 2,2',3-Trichlorobiphenyl

Synonym: PCB-16, 2,2',3-trichloro-1,1'-biphenyl

Chemical Name: 2,2',3-trichlorobiphenyl

CAS Registry No: 38444-78-9

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

28.1–28.8 (Weingarten 1961; Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.934 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.505 (supercooled liquid, calculated-TSA, Burkhard et al. 1985b)

0.293 ($20^{\circ}C$, supercooled liquid, calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.205 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.814 (calculated-TSA, Abramowitz & Yalkowsky 1990)

0.174 (calculated-MCI χ , Patil 1991)

0.674 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0522, 0.066, 0.033 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985a)

0.069 (supercooled liquid, GC-RI correlation, Burkhard et al. 1985b)

0.0538, 0.060 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0275 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 10.10 - 4100/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0427; 0.0427 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -3935/(T/K) + 11.93$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.0506; 0.0427 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI; quoted lit., Saçan & Balcioglu 1998)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$ or as indicated):

35.16 (calculated-P/C, Burkhard et al. 1985b)

80.0 (calculated-P/C, Shiu & Mackay 1986)

24.11 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

81.77 (batch stripping, Atlas et al. 1982)

28.07 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

20.27 (wetted-wall column-GC/ECD, Brunner et al. 1990)

25.45 (calculated-QSPR, Dunnivant et al. 1992)

4.02, 11.74 (0, $15^{\circ}C$, from modified two-film exchange model, Hornbuckle et al. 1994)

9.36 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

25.2 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 47 \pm 24$ kJ/mol, $\Delta S_H = 0.12 \pm 0.08$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 5.36 (calculated-TSA, Burkhard 1984)
- 4.15 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 5.31 (calculated- π const., Rapaport & Eisenreich 1984)
- 5.12 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
- 5.12 (recommended, Sangster 1993)
- 5.31 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations.:

- 7.22; 7.18 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
- $\log K_{OA} = -6.50 + 4240/(T/K)$ (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
- 8.87, 7.98 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
- 7.32 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.16 (suspended particulate matter, Burkhard 1984)
- 6.0 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 4.52 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
- 5.00 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7 - 1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30$ d, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 7.2 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (1.0 - 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15$ d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 50% degraded by Nocardia strain NCIB 10603 within 7 d (Baxter et al. 1975; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 90$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.010 \text{ d}^{-1}$ with $t_{1/2} = 72$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines for $\text{OH}\cdot$ oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 90$ d for high-dose treatment, $t_{1/2} = 72$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.17 2,2',4-Trichlorobiphenyl (PCB-17)

Common Name: 2,2',4-Trichlorobiphenyl

Synonym: PCB-17, 2,2',4-trichloro-1,1'-biphenyl

Chemical Name: 2,2',4-trichlorobiphenyl

CAS Registry No: 37680-66-3

Molecular Formula: $C_{12}H_8Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

35 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.292 (supercooled liquid S_L , Burkhard et al. 1985a)

0.259 (supercooled liquid S_L , Murphy et al. 1987)

0.103 (RP-HLC- k' correlation, Brodsky & Ballschmiter 1988)

0.647 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.080 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0566, 0.0828, 0.0219 (P_L supercooled liquid values: calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.0705, 0.0739 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0335 (supercooled liquid P_L , Murphy et al. 1987)

0.0692; 0.0526 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -3935/(T/K) + 12.05$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.0692; 0.526 (P_L , quoted lit.; calculated-MCI $^3\chi$ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)

Henry's Law Constant (Pa·m³/mol at $25^{\circ}C$ or as indicated):

52.18 (calculated-P/C, Burkhard et al. 1985b)

33.03 (calculated-P/C, Murphy et al. 1987)

40.63 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

37.82 (calculated-QSPR, Dunnivant et al. 1992)

26.04 (calculated-QSPR, Achman et al. 1993)

13.9 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

32.1 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 39 \pm 21$ kJ/mol, $\Delta S_H = 0.10 \pm 0.07$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.60, 5.76 (RP-HPLC-RT correlation: uncorrected, with ortho correction, Rapaport & Eisenrich 1984)

5.39 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

5.50 (generator column-GC, Larsen et al. 1992)

- 5.50 (recommended, Sangster 1993)
 5.76 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 8.06; 7.74 (0; 20°C, multi-column GC-k' correlation, Zhang et al. 1999)
 7.11 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.24 (suspended particulate matter, Burkhard 1984)
 6.20 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 4.84 (calculated-QSAR-MCI χ , Sabljic et al. 1995)
 5.20; 4.60 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7 - 1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14-30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 7.5 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4-11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1-10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (1.0 - 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9-15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.009 \text{ d}^{-1}$ with $t_{1/2} = 81 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 99 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14-30 d due to calculated rate constant of gas-phase reaction with OH radicals for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9-17 d based on the calculated rate constant for gas-phase reaction with OH radicals for trichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4-11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1-10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991)

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 81 \text{ d}$ for high-dose treatment, $t_{1/2} = 99 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.18 2,2',5-Trichlorobiphenyl (PCB-18)

Common Name: 2,2',5-Trichlorobiphenyl

Synonym: PCB-18, 2,2',5-trichloro-1,1'-biphenyl

Chemical Name: 2,2',5-trichlorobiphenyl

CAS Registry No: 37680-65-2

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

43–44 (Hutzinger et al. 1974; Erickson 1986)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.1485

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

198.7 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.648 (Mackay et al. 1980)

0.651 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.640 (shake flask-GC/ECD, Weil et al. 1974)

0.248 (shake flask-GC/ECD, Haque & Schmedding 1975)

0.016 (radioactive isotope- ^{14}C labeled, Metcalf et al. 1975)

0.0614 (shake flask-GC/ECD from Aroclor 1242, Lee et al. 1979)

0.085 (Kenaga & Goring 1980; Kenaga 1980)

0.110 (shake flask GC/ECD, Bruggeman et al. 1981)

0.299 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.203, 0.135, 0.100, 0.112 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.510; 0.780 (generator column-GC/ECD, supercooled liquid S_L , Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.267 (Neely 1981)

0.412 (P_L calculated from P_S using fugacity ratio F, Neely 1981)

0.012 (Neely 1983)

0.0904 (supercooled liquid P_L , Burkhard 1984)

0.0605 (GC-RI correlation, Burkhard et al. 1985a)

0.0904 (supercooled liquid P_L , GC-RT correlation, Burkhard et al. 1985b)

0.0776, 0.0833 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.143; 0.220 (selected: solid P_S ; supercooled liquid P_L , Shiu & Mackay 1986)

0.0352 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log (P/mmHg) = 10.10 - 4090/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0603, 0.0851 (supercooled liquid P_L ; GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -3935/(T/K) + 12.09$; (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.033–0.0762; 0.035–0.116 (literature P_S range; literature P_L range, Delle Site 1997)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 101.53 (23°C, gas stripping-GC, Atlas et al. 1982)
 20.26 (20°C, gas stripping-GC, Oliver 1985)
 38.5 (gas stripping-GC/ECD, Dunnivant & Elzerman 1988)
 25.33 (wetted-wall column-GC/ECD, Brunner et al. 1990)
 8.11, 12.07, 17.64, 25.358* ± 0.34, 34.14 (4, 11, 18, 25, 31°C, gas stripping-GC, Bamford et al. 2000)
 $\ln K_{AW} = 9.5020 - 4197.74/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)
 $K_{AW} = \exp[-(34.9/kJ\cdot mol^{-1})/RT] + (0.079/kJ\cdot mol^{-1}\cdot K^{-1})/R]$; where $R = 8.314 J\cdot K^{-1}\cdot mol^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)
 25.3 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 35 \pm 3 kJ/mol$, $\Delta S_H = 0.08 \pm 0.01 kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, log K_{OW} :

- 3.89 (radiolabeled-¹⁴C, Metcalf et al. 1975)
 6.22 (shake flask, Hansch & Leo 1979)
 5.88 (calculated after Rekker 1977, Könemann 1981)
 5.64 (RP-TLC- k' correlation, Bruggeman et al. 1982)
 5.59; 4.34 (generator column-GC/ECD; HPLC-RT correlation, Woodburn 1982)
 4.39, 5.55 (RP-HPLC-RT correlation, uncorrected, with ortho correction, Rapaport & Eisenreich 1984)
 5.60; 4.34 (generator column-GC/ECD; HPLC-RT correlation, Woodburn et al. 1984)
 4.97 (HPLC-RT correlation, DeVoe et al. 1987)
 4.97, 5.68 (HPLC- k' correlation, De Kock & Lord, 1987)
 5.60 (generator column-GC/ECD, Doucette & Andren 1987,1988)
 5.31, 5.37, 5.29, 5.37 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.55 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 5.44 (generator column-GC, Larsen et al. 1992)
 5.44 (recommended, Sangster 1993)
 5.60 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated and reported temperature dependence equations:

- 7.60; 7.12 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
 $\log K_{OA} = -6.00 + 4060/(T/K)$; temp range 10–43°C (fugacity meter, Kömp & McLachlan 1997a)
 8.39 (10°C, estimated, Thomas et al. 1998)
 8.70, 7.79 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 7.48 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 3.86, 3.76, 2.91, 3.81 (algae, snail, mosquito, fish, ¹⁴C-labeled, Metcalf et al. 1975)
 1.72 (green sunfish, 15 d in static water, Sanborn et al. 1975)
 3.39 (calculated-S, Kenaga 1980)
 5.52; 5.83 (goldfish: 10% lipid by wt. in food; 3% lipid, static equilibration system-GC/ECD, 23-d exposure studies, Bruggeman et al. 1981)
 3.43–4.23 highest value 4.23 not equilibrated (rainbow trout, 15°C, steady-state BCF of 7- to 96-d laboratory study, Oliver & Niimi 1985)
 4.91, 4.23; 5.77 (rainbow trout, laboratory data: kinetic BCF(k_1/k_2), steady-state BCF (C_F/C_W); Lake Ontario field BCF, Oliver & Niimi 1985)
 4.30 (fish, calculated- C_B/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)
 3.75 (*Picea omorika*, Reischl et al. 1989 from Reischl 1988)
 4.23 (fish, Isnard & Lambert 1989)
 5.82; 5.87 (goldfish; rainbow trout, Noegrohati & Hammers 1992)
 4.11; 5.64 (zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)

- 2.60–4.19 (various marine species, mean dry wt. BCF, Hope et al. 1998)
 4.08–6.01 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
 4.23, 5.32 (rainbow trout, flow through-96-d: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.30, 5.60 (goldfish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.11, 5.64 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

- 4.50, 4.50, 5.0 (sediments: offshore Grand Haven 2.0% OC, nearshore Grand Haven 3.4% OC, Benton Harbor sediment 3.8% OC, batch equilibrium-sorption isotherm, Voice et al. 1983; Voice & Weber, Jr., 1985)
 5.24 (suspended particulate matter, Burkhard 1984)
 5.40; 5.50; 5.20 (field data of sediment trap material; Niagara River-organic matter; calculated- K_{OW} , Oliver & Charlton 1984)
 5.1–6.3, 5.5; 7.0 (suspended sediment, average; algae > 50 μ m, Oliver 1987a)
 4.57, 4.85 (natural solids, Aldrich humic acid, equilibrium dialysis, Chin & Weber 1989, Chin et al. 1990)
 5.34 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
 4.49 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
 4.85, 4.15 (Aldrich humic acid substrate with methyl salicylate, organic polymers present in Huron River water, Chin et al. 1990)
 5.90 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 4.23 (soil, calculated-MCI, Sabljic et al. 1995)
 4.53; 4.57 (soil, calculated-Characteristic Root Index [CRI]; quoted lit., Saçan & Balcioglu 1996)
 5.20; 4.60 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)
 4.85 (sediment: organic carbon OC \geq 0.5%, average, Delle Site 2001)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7 - 1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 6.9 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (1.0 - 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 50–80% being degraded by *Alcaligenes* sp. strain Y-42 from lake sediments within 7-h period (Furukawa & Matsumura 1976; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 950 \text{ d}^{-1}$; $k_2 = 0.048 \text{ d}^{-1}$ (23°C, goldfish, 3% lipid content, Bruggeman et al. 1981; quoted, Waid 1986; Clark et al. 1990)

$k_2 = 0.0037 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark 1990)

$k_2 = 0.048, 0.0372 \text{ d}^{-1}$ (goldfish, exptl., correlated, Mackay & Hughes 1984)

$k_1 = 300 \text{ d}^{-1}$; $k_2 = 0.0037 \text{ d}^{-1}$ (rainbow trout, Oliver & Niimi 1985)

$k_1 = 39.6 \text{ h}^{-1}$; $1/k_2 = 500 \text{ h}$ (goldfish, quoted, Hawker & Connell 1985)

$\log k_1 = 2.98 \text{ d}^{-1}$; $\log 1/k_2 = 1.32 \text{ d}$ (goldfish, quoted, Connell & Hawker 1988b)

$\log 1/k_2 = 2.4, 2.4 \text{ d}$ (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b).

$\log 1/k_2 = 1.32 \text{ d}$ (goldfish, quoted, Connell & Hawker 1988b; Thomann 1989)

$k_1 = 3760 \text{ d}^{-1}$; $k_2 = 0.292 \text{ d}^{-1}$ (zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.020 \text{ d}^{-1}$ with $t_{1/2} = 36 \text{ d}$ and $k_2 = 0.029 \text{ d}^{-1}$ with $t_{1/2} = 24 \text{ d}$ for food concn of 29 ng/g and 182 ng/g, respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_2 = 0.009 \text{ d}^{-1}$ with $t_{1/2} = 79 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 96 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 43.1 \text{ d}$ in Lake Michigan (Neely 1983); $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991).

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: 0.47 d^{-1} from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, 1.16 d^{-1} from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, 1.21 d^{-1} from Tarehee surface soil consist of sand and silt with 0.02% OC and 0.17 d^{-1} from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: 0.00838 d^{-1} from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, 0.00368 d^{-1} from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, 0.00357 d^{-1} from Tarehee surface soil consist of sand and silt with 0.02% OC and 0.00062 d^{-1} from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).

Biota: $t_{1/2} = 190 \text{ d}$ in rainbow trout, 190 d and its muscle 86 d (Niimi & Oliver 1983);

$t_{1/2} = 190 \text{ d}$ in fish (rainbow trout, Niimi & Oliver 1983; Oliver & Niimi 1985);

$t_{1/2} = 26 \text{ d}$ in worms at 8°C (Oliver 1987c);

$t_{1/2} = 25 \text{ d}$ in omorika (Reischl et al. 1989)

Depuration $t_{1/2} = 32\text{--}42 \text{ d}$ for a 32-d dietary exposure followed by a 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 79 \text{ d}$ for high-dose treatment, $t_{1/2} = 96 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.19 2,2',6-Trichlorobiphenyl (PCB-19)

Common Name: 2,2',6-Trichlorobiphenyl

Synonym: PCB-19, 2,2',6,-trichloro-1,1'-biphenyl

Chemical Name: 2,2',6-trichlorobiphenyl

CAS Registry No: 38444-73-4

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

46 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

45.09 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

23.30 (wetted-wall column-GC, Brunner et al. 1990)

44.74 (calculated-QSPR, Dunnivant et al. 1992)

13.9 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

32.2 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 39 \pm 21$ kJ/mol, $\Delta S_H = 0.10 \pm 0.07$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.75, 5.48 (RP-HPLC correlation: uncorrected, with ortho correction, Rapaport & Eisenreich 1984)

4.88, 5.06, 5.03, 5.19 (RP-HPLC- k' correction, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

- 5.04 (recommended, Sangster 1993)
 5.48 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 6.72 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.28 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.90 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7 - 1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14-30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (1.0 - 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9-15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 155 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 84 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radicals for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–15 d based on the calculated rate constant for gas-phase reaction with OH radicals for trichlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 155 \text{ d}$ for high-dose treatment, $t_{1/2} = 84 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.20 2,3,3'-Trichlorobiphenyl (PCB-20)

Common Name: 2,3,3'-Trichlorobiphenyl

Synonym: PCB-20, 2,3,3'-trichloro-1,1'-biphenyl

Chemical Name: 2,3,3'-trichlorobiphenyl

CAS Registry No: 38444-84-7

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

58 (calculated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

337 (calculated, Mackay et al. 1982; Shiu & Mackay 1986)

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.402 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985a)

0.162 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.174 (calculated-MCI χ , Patil 1991)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.033 (supercooled liquid P_L , GC-RT correlation, Burkhard et al. 1985a)

0.0283 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.0269 (supercooled liquid P_L , GC-RT correlation, Foreman & Bidleman 1985)

$\log(P/mmHg) = 10.40 - 4310/(T/K)$, (GC-RT correlation, Tateya et al. 1988)

0.0302 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4075/(T/K) + 12.12$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry' Law Constant (Pa m^3/mol at $25^{\circ}C$):

81.77 (batch stripping-GC, Atlas et al. 1982)

17.23 (calculated-P/C, Burkhard et al. 1985b)

30.7 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

16.21 (wetted-wall column-GC/ECD, Brunner et al. 1990)

22.01 (calculated-QSPR, Dunnivant et al. 1992)

29.0 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 41 \pm 4$ kJ/mol, $\Delta S_H = 0.10 \pm 0.07$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.99, 5.57 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)

5.57 (calculated-TSA, Hawker & Connell 1988a)

5.68 (generator column-GC, Larsen et al. 1992)

5.62 (recommended, Sangster 1993)

5.57 (recommended, Hansch et al. 1995)

5.4846 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated:

9.51, 8.49 (0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)

7.95 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

5.23 (suspended particulate matter, Burkhard 1984)

4.01–4.88; 5.20 (range, calculated from sequential desorption of 11 urban soils; lit. value, Krauss & Wilcke 2001)

5.13; 5.01, 4.88, 5.45 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F:

0.694 (calculated-assuming $\Delta S_{fus} = 56$ J/mol K, Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.402 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.162 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.223 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0402 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0291 (GC-RI correlation, Burkhard et al. 1985b)

0.0447 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4075/(T/K) + 12.36$, (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

25.74 (calculated-P/C, Burkhard et al. 1985a)

35.6 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

32.26 (calculated-QSPR, Dunnivant et al. 1992)

29.0 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 41 \pm 4$ kJ/mol, $\Delta S_H = 0.10 \pm 0.02$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.44 (calculated-TSA, Burkhard 1984)

5.53 (calculated, Miertus & Jakus 1990; quoted, Sangster 1993)

5.57 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

5.6729 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.17 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.23 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7\text{--}1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (1.0\text{--}2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.24 2,3,6-Trichlorobiphenyl (PCB-24)

Common Name: 2,3,6-Trichlorobiphenyl

Synonym: PCB-24, 2,3,6-trichloro-1,1'-biphenyl

Chemical Name: 2,3,6-trichlorobiphenyl

CAS Registry No: 55702-45-9

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

49 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7\text{--}1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 6.3 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, 0.1–10 d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (1.0\text{--}2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: biodegraded fairly quickly by *Alcaligenes* sp. strain Y-42 from lake sediments but small residue was detected after 7 h (Furukawa & Matsumura 1976; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 105 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 135 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 105 \text{ d}$ for high-dose treatment, $t_{1/2} = 135 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.27 2,3',6-Trichlorobiphenyl (PCB-27)

Common Name: 2,3',6-Trichlorobiphenyl

Synonym: PCB-27, 2,3',6-trichloro-1,1'-biphenyl

Chemical Name: 2,3',6-trichlorobiphenyl

CAS Registry No: 38444-81-4

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

45 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.404 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985a)

0.039 (supercooled liquid S_L , Murphy et al. 1987)

0.256 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0653 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0676 (GC-RI correlation, Burkhard et al. 1985b)

0.0598, 0.0628 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

4.26×10^{-3} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.0490, 0.0708 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -3935/(T/K) + 11.97$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

41.64 (calculated-P/C, Burkhard et al. 1985a)

49.95 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

41.0 (calculated-QSPR, Dunnivant et al. 1992)

22.17 (quoted as PCB-24 and 27, Achman et al. 1993)

27.3 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 42 \pm 6 kJ/mol$, $\Delta S_H = 0.10 \pm 0.02 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.43 (calculated-TSA, Burkhard 1984)

5.44 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

5.52 (calculated, Miertsus & Jakus 1990; quoted, Sangster 1993)

5.50 (quoted as PCB-24 and 27, Murray & Andren 1992)

5.2417 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.27 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

5.23 (suspended particulate matter, Burkhard 1984)

6.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7-1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14-30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 7.6 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4-11 d in freshwater systems, 0.1-10 d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (1.0-2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9-15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 91 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.009 \text{ d}^{-1}$ with $t_{1/2} = 81 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14-30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9-17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4-11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1-10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 91 \text{ d}$ for high-dose treatment, $t_{1/2} = 81 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.28 2,4,4'-Trichlorobiphenyl (PCB-28)

Common Name: 2,4,4'-Trichlorobiphenyl

Synonym: PCB-28, 2,4,4'-trichloro-1,1'-biphenyl

Chemical Name: 2,4,4'-trichlorobiphenyl

CAS Registry No: 7012-37-5

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

57–58 (Hutzinger et al. 1971, 1974)

Boiling Point ($^{\circ}C$):

206–207 (Sengupta 1966)

Density (g/cm^3 at $20^{\circ}C$): 1.1485Molar Volume (cm^3/mol):

- 4.84; 4.24 (Fluka-Tridom humic acid; Calcasieu River humic extract, Chiou et al. 1987)
- 3.53; 3.27 (Suwannee River water sample; Sopchoppy River water sample, Chiou et al. 1987)
- 5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 4.03–4.91; 5.30–5.30 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
- 5.25; 5.27, 4.91, 5.32 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolysis rate k_p (exptl) = $6 \times 10^{-8} \text{ d}^{-1}$ with $t_{1/2} = 133 \text{ d}$; k_p (calc) = $2.2 \times 10^{-8} \text{ d}^{-1}$ in winter sunlight at 40°L in surface waters (Dulin et al. 1986)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k_{OH} (calc) = $(0.7\text{--}1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime τ (calc) = 14–30 d, due to gas-phase loss process at room temp. (Atkinson 1987)

k_{OH} (aq.) = $7.2 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, 0.1–10 d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

k_{OH} (calc) = $(1.0\text{--}2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime τ (calc) = 6.9–15 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: $t_{1/2} = 7 \text{ h}$ of biodegradation by *Alcaligenes* sp. strain Y-42 from lake sediments (Furukawa & Matsumura 1976; quoted, Pal et al. 1980);

49% degradation at 72 h in one of the defined PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.016 \text{ d}^{-1}$ with $t_{1/2} = 44 \text{ d}$ and $k_2 = 0.015 \text{ d}^{-1}$ with $t_{1/2} = 46 \text{ d}$ for food concn of 16 ng/g and 108 ng/g, respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_1 = 0.00054 \text{ h}^{-1}$; $k_2 = 0.089 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)

k_1 (calc) = 11 (food lipid (mg)/(g worm lipid-d); k_2 (calc) = 0.14 d^{-1} (earthworm, Wågman et al. 2001)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 91 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 88 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

- Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);
tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995);
 $t_{1/2} = 72$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).
- Surface water: photolysis $t_{1/2} = 133$ d in winter sunlight at 40°L in surface waters (Dulin et al. 1986);
half-lives range from $t_{1/2} \sim 4$ –11 d in freshwater systems, $t_{1/2} = 0.1$ –10 d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991);
 $t_{1/2} = 1450$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).
- Groundwater:
- Sediment: $t_{1/2} = 26000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).
- Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: 0.47 d⁻¹ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, 1.15 d⁻¹ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, 1.34 d⁻¹ from Tarehee surface soil consist of sand and silt with 0.02% OC and 0.53 d⁻¹ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are; 0.00378 d⁻¹ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, 0.00183 d⁻¹ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, 0.0016 d⁻¹ from Tarehee surface soil consist of sand and silt with 0.02% OC and 0.00044 d⁻¹ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).
 $t_{1/2} = 26000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).
- Biota: depuration $t_{1/2} = 44$ –46 d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 $t_{1/2} = 7.8$ h in blood plasma (ring doves, Drouillard & Norstrom 2000);
elimination $t_{1/2} = 5$ d in earthworm given contaminated food (predicted, Wågman et al. 2001)
depuration $t_{1/2} = 91$ d for high-dose treatment, $t_{1/2} = 88$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.29 2,4,5-Trichlorobiphenyl (PCB-29)

Common Name: 2,4,5-Trichlorobiphenyl

Synonym: PCB-29, 2,4,5-trichloro-1,1'-biphenyl

Chemical Name: 2,4,5-trichlorobiphenyl

CAS Registry No: 15862-07-4

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

78.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.1485

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

198.7 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

22.8 (differential scanning calorimetry, Miller et al. 1984; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

65.27 (Miller et al. 1984)

65.24, 63.0 (literature exptl. value, calculated, Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

0.30 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.092 (generator column-GC/ECD, Weil et al. 1974)

0.119 (Dexter & Pavlou 1978)

0.140 (generator column-HPLC/UV, Billington 1982; Billington et al. 1988)

0.142 (generator column-HPLC/UV, Huang 1983)

0.162 (generator column-GC/ECD, Miller et al. 1984, 1985)

0.0098, 0.107, 0.138, 0.120 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.106* \pm 0.0045 (generator column-GC/ECD, Shiu et al. 1997)

0.0413, 0.0682, 0.106, 0.203, 0.33 (5, 15, 25, 35, $45^{\circ}C$, generator column-GC, Shiu et al. 1997)

$\ln x = -3.06175 - 4633.86/(T/K)$, temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

0.479, 0.389 (supercooled liquid: derivation of literature-derived value, final-adjusted value, Li et al. 2003)

$\log S_L/(mol m^{-3}) = -824/(T/K) + 0.03$ (supercooled liquid, linear regression of literature data, Li et al. 2003)

$\log S_L/(mol m^{-3}) = -977/(T/K) + 0.46$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0443 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

0.0112 (GC-RI correlation, Burkhard et al. 1985a)

0.0320 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.0453, 0.0464 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log (P_L/Pa) = -4075/(T/K) + 12.20$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.0263 ($20^{\circ}C$, supercooled liquid P_L , from Falconer & Bidleman 1994; Harner & Bidleman 1996)

0.0447, 0.0457 (supercooled liquid P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log P_L/Pa = -3904/(T/K) + 11.75$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

20.27 (wetted-wall column-GC, Brunner et al. 1990; quoted, Achman et al. 1993)

37.89* ± 0.53 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)

$\ln K_{AW} = 9.863 - 4197.74/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(34.9/\text{kJ}\cdot\text{mol}^{-1})/RT + (0.082/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R]$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)

36.3 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 35 \pm 3 \text{ kJ/mol}$, $\Delta S_H = 0.08 \pm 0.01 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

32.36, 30.20 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

$\log [H/(\text{Pa m}^3/\text{mol})] = -1674/(T/K) + 7.13$ (LDV linear regression of literature data, Li et al. 2003)

$\log [H/(\text{Pa m}^3/\text{mol})] = -2927/(T/K) + 11.30$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$ or as indicated and reported temperature dependence equations:

6.22 (Hansch & Leo 1979)

5.77 (RP-TLC- k' correlation, Bruggeman et al. 1982)

5.86 (HPLC-RT correlation, Woodburn 1982)

5.51 (generator column-GC/ECD, Miller et al. 1984)

5.81 (generator column-GC, Woodburn et al. 1984)

5.86 (HPLC-RT correlation, Woodburn et al. 1984)

6.25 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)

5.66 (HPLC-RP/MS, Burkhard & Kuehl 1986)

5.81 (generator column-GC/ECD, Doucette & Andren 1987)

5.78, 5.82, 5.88, 5.76 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

5.86 (shake flask/slow stirring-GC, De Bruijn et al. 1989)

5.901 ± 0.007 (shake flask/slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)

5.54 (HPLC- k' correlation, Noegrohati & Hammers 1992)

5.81 (recommended, Sangster 1993)

5.90 (recommended, Hansch et al. 1995)

5.74, 5.60 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

7.96* (generator column-GC, measured range –10 to 20°C, Harner & Mackay 1995)

$\log K_{OA} = -4.80 + 3791.7/(T/K)$; temp range –10 to +20°C (generator column-GC, Harner & Mackay 1995)

8.03 (20°C, generator column-GC, Harner & Bidleman 1996)

$\log K_{OA} = -4.77 + 3792/(T/K)$; temp range –10 to +20°C (generator column-GC, Harner & Bidleman 1996)

9.15, 8.05 (0, 20°C, multi-column GC- k' correlation; Zhang et al. 1999)

8.21 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

8.01; 8.03 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

7.80, 7.78 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log K_{OA} = 4175/(T/K) - 6.22$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$:

4.97 (guppy, lipid wt. based, Gobas et al. 1989)

5.41 (guppy, corr. lipid wt. based, Gobas et al. 1989)

4.36, 5.53 (guppy: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

5.26 (suspended particulate matter, Burkhard 1984)

4.51 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constants $k = (0.019\text{--}0.022) \text{ min}^{-1}$ with $t_{1/2} = 31\text{--}36 \text{ min}$, $k = (0.033\text{--}0.048) \text{ min}^{-1}$ with $t_{1/2} = 14\text{--}21 \text{ min}$ and $k = (0.13\text{--}0.14) \text{ min}^{-1}$ with $t_{1/2} = 5 \text{ min}$ in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; rate constants $k = (0.0056\text{--}0.020) \text{ min}^{-1}$ with $t_{1/2} = 35\text{--}123 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}(\text{calc}) = (0.7\text{--}1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{calc}) = (1.0\text{--}2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: half-life of biodegradation by *Alcaligenes* sp. strain Y-42 from lake sediments estimated to be less than 7 h (Furukawa & Matsumura 1976; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$\log k_2 = -1.68 \text{ d}^{-1}$ (fish, quoted, Hawker & Connell 1985; Thomann 1989)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 190 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 100 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987); tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 31\text{--}36 \text{ min}$, 14–21 min and 5 min in aqueous Aroclor 1248 solution containing 45 ng/mL of total PCB irradiated by UVA-340 in the presence of 25, 50 and 100 $\mu\text{g/mL}$ TiO_2 , respectively; $t_{1/2} = 35\text{--}123 \text{ min}$ in aqueous Aroclor mixtures (Aroclor 1221, 1016, 1254, 1260) solution containing 450 ng/mL of total PCB irradiated by sunlight in the presence of 100 $\mu\text{g/mL}$ TiO_2 (Huang et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 190 \text{ d}$ for high-dose treatment, $t_{1/2} = 100 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.29.1
Reported aqueous solubilities, Henry’s law constants and octanol-air partition coefficient log of 2,4,5-trichlorobiphenyl (PCB-29) at various temperatures

Solubility		Henry’s law constant		log K _{OA}	
Shiu et al. 1997		Bamford et al. 2000		Harner & Mackay 1995	
generator column-GC/ECD		gas stripping-GC/MS		generator column-GC	
t/°C	S/g·m ⁻³	t/°C	H/(Pa m ³ /mol)	t/°C	log K _{OA}
5	0.0413	4	12.12	−10	9.5
15	0.0682	11	18.04	0	8.97
25	0.106	18	28.37	10	8.51
35	0.203	25	37.89	20	8.03
45	0.330	31	51.03	25	7.96

$\Delta H_{\text{sol}}/(\text{kJ mol}^{-1}) = 36.9$
at 5–45°C

$\ln K_{\text{AW}} = -\Delta H/RT + \Delta S/R$
 K_{AW}
A 9.8629
B 4197.74
enthalpy, entropy change:
 $\Delta H/(\text{kJ}\cdot\text{mol}^{-1}) = 34.9 \pm 2.8$
 $\Delta S/(\text{J}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}) = 82 \pm 10$

7.1.1.30 2,4,6-Trichlorobiphenyl (PCB-30)

Common Name: 2,4,6-Trichlorobiphenyl

Synonym: PCB-30

Chemical Name: 2,4,6-trichlorobiphenyl

CAS Registry No: 35693-92-6

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

62.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

16.5 (differential scanning calorimetry, Miller et al. 1984; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

49.37 (Miller et al. 1984)

49.36, 63.0 (literature exptl. value, calculated, Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F :

0.427 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.226 (generator column/ECD, Miller et al. 1984,1985)

0.024, 0.0468, 0.0491, 0.0893 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.187* (generator column-GC/ECD, measured range $4-40^{\circ}C$, Doucette & Andren 1988)

0.0803, 0.187, 0.435 (4, 25, $40^{\circ}C$, generator column-GC/ECD, Doucette & Andren 1988)

$S/(mol/L) = 2.49 \times 10^{-7} \exp(0.047 \cdot t/^{\circ}C)$ (generator column-GC/ECD, temp range $4-40^{\circ}C$, Doucette & Andren 1988a); or

$\log x = -1742/(T/K) - 1.983$, temp range $4-40^{\circ}C$ (generator column-GC/ECD, Doucette & Andren 1988a)

0.252, 0.243 (generator column-GC, Dunnivant & Elzerman 1988)

0.236 (generator column-GC, Li et al. 1992)

0.235 (generator column-GC/ECD, Li et al. 1993)

0.217 (shake flask-GC/ECD, Li & Andren 1994)

$\ln x = -4.5969 - 4004.7/(T/K)$, temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.031 (Augood 1953; quoted, Bidleman 1984)

0.0865, 0.0948(P_{GC} by GC-RT correlation, different stationary phases, Bidleman 1984)

0.030 (supercooled liquid P_L , converted from literature P_s with ΔS_{fus} Bidleman 1984)

0.0955, 0.144(supercooled liquid P_L calculated from P_{GC} , GC-RT correlation, different stationary phases, Bidleman 1984)

0.0421 (GC-RI correlation, Burkhard et al. 1985a)

0.111, 0.135(supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0946 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.110; 0.0851(supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -3886/(T/K) + 12.02$; (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.0130–0.0637; 0.085–0.146 (literature P_s range; literature P_L range, Delle Site 1997)

Henry's Law Constant (Pa m³/mol at 25°C):

- 61.40 (calculated-P/C, Burkhard et al. 1985b)
- 49.51 (calculated-P/C, Shiu & Mackay 1986)
- 65.76 (batch stripping, Dunnivant et al. 1988 Dunnivant & Elzerman 1988)
- 47.51 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
- 58.04 (calculated-QSPR, Dunnivant et al. 1992)
- 27.3 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)
- $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 42 \pm 6$ kJ/mol, $\Delta S_H = 0.10 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, log K_{OW}:

- 5.47 (generator column-GC/ECD, Miller et al. 1984, 1985)
- 5.57 (generator column-GC/ECD, Doucette & Andren 1987, 1988)
- 5.77, 5.70, 5.51, 5.48 (RP-HPLC-k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 5.33, 5.57 (RP-HPLC-k' correlation, different stationary phases, Sherblom & Eganhouse 1988)
- 5.711 \pm 0.014 (shake flask/slow stirring, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
- 5.75 (generator column-GC, Li et al. 1993)
- 5.62 (recommended, Sangster 1993)
- 5.71 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA}:

- 7.28 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC}:

- 5.24 (suspended particulates matter, Burkhard 1984)
- 4.52 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO₃} with NO₃ radical and k_{O₃} with O₃ or as indicated, *data at other temperatures see reference:

k_{OH}(calc) = (0.7–1.6) \times 10⁻¹² cm³ molecule⁻¹ s⁻¹ for trichlorobiphenyls, and the tropospheric lifetime τ (calc) = 14–30 d, due to gas-phase loss process at room temp. (Atkinson 1987)

k_{OH}(calc) = (1.0–2.1) \times 10⁻¹² cm³ molecule⁻¹ s⁻¹ for trichlorobiphenyls, and the tropospheric lifetime τ (calc) = 6.9–15 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 30% degradation at 72 h in one of the PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k₁) and Elimination (k₂) Rate Constants:

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);
tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota:

7.1.1.31 2,4',5-Trichlorobiphenyl (PCB-31)

Common Name: 2,4',5-Trichlorobiphenyl

Synonym: PCB-31, 2,4',5-trichloro-1,1'-biphenyl

Chemical Name: 2,4',5-trichlorobiphenyl

CAS Registry No: 16606-02-3

Molecular Formula: $C_{12}H_7Cl_3$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

67 (Bellavita 1935; Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

198.7 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

0.384 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.11 (Kilzer et al. 1979)

0.075 (shake flask-GC/ECD, Bruggeman et al. 1981)

0.265, 0.155, 0.179, 0.120 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.090 (generator column-GC/ECD, Opperhuizen et al. 1988)

0.143 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.220, 0.194 (supercooled liquid: derivation of literature-derived value, final-adjusted value, Li et al. 2003)

$\log S_L/(mol m^{-3}) = -1123/(T/K) + 0.64$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0341, 0.0474 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Bidleman 1984)

0.0132 (GC-RI correlation, Burkhard et al. 1985a)

0.0313 (supercooled liquid P_L , calculated-GC-RI correlation, Burkhard et al. 1985b)

0.0373, 0.0346 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0149 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log (P/mmHg) = 10.40 - 4270/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0263, 0.0347 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -4058/(T/K) + 12.14$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.024, 0.0257 (supercooled liquid P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log (P_L/Pa) = -4149/(T/K) + 12.29$ (supercooled liquid, linear regression of literature data, Li et al. 2003)

$\log (P_L/Pa) = -4010/(T/K) + 11.86$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

94.13 (gas-stripping-GC, Atlas et al. 1982)

20.26 (calculated, Murphy et al. 1983)

25.43 (calculated-P/C, Burkhard et al. 1985b)

26.75 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

- 28.47 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 19.25 (wetted-wall column-GC/ECD, Brunner et al. 1990)
 27.78 (calculated-QSPR, Dunnivant et al. 1992)
 20.21 (calculated-QSPR, Achman et al. 1993)
 12.9 (11°C, gas stripping-GC/ECD, Bamford et al. 2002)
 30.7 (from 11°C exptl. data and compensation point, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 41 \pm 21$ kJ/mol, $\Delta S_H = 0.10 \pm 0.08$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004
 37.15, 33.88 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)
 $\log [H/(\text{Pa m}^3/\text{mol})] = -2887/(T/K) + 11.22$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.22 (Hansch & Leo 1979)
 5.30 (HPLC-RT correlation, Woodburn 1982; Woodburn et al. 1984)
 5.77 (RP-TLC- k' correlation, Bruggeman et al. 1982)
 5.69 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
 5.79 (generator column-GC/ECD, Woodburn et al. 1984)
 5.70 (selected, Shiu & Mackay 1986)
 5.99, 6.22, 6.18, 6.33 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.79 (generator column-GC/ECD, Doucette & Andren 1987, 1988)
 5.59 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 5.68 (recommended, Sangster 1993)
 5.79 (recommended, Hansch et al. 1995)
 5.79, 5.78 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations:

- 7.92 (fugacity meter/generator column-GC; Kömp & McLachlan 1997a)
 $\log K_{OA} = -6.12 + 4190/(T/K)$ (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
 9.43, 8.40; 8.23 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 8.13 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
 7.93, 7.94 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log K_{OA} = 4110/(T/K) - 5.84$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$:

- 3.45 (fish, Korte et al. 1978)
 -0.30, -0.22 (adipose tissue of male, female Albino rats, Geyer et al. 1980)
 6.15 (goldfish, 3% lipid, static equilibration system-GC/ECD, 23-d exposure, Bruggeman et al. 1981)
 5.98 (goldfish, 10% lipid content in food, Bruggeman et al. 1981)
 3.95, 3.95, 4.51 (algae, fish, activated sludge, Freitag et al. 1984, 1985)
 3.66 (salmon fry in humic water-steady state, Carlberg et al. 1986)
 3.83 (salmon fry in lake water-steady state, Carlberg et al. 1986)
 4.62 (fish, calculated- C_B/C_W or k_1/k_2 Connell & Hawker 1988; Hawker 1990)
 4.66; 6.19 (zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)
 4/09 (algae *Chlorella fusca*, wet wt basis, Wang et al. 1996)
 5.04 (Baltic Sea blue mussels, flow-through exptl, dry wt., Gustafsson et al. 1999)
 3.95, 4.65 (algae: wet wt basis, dry wt basis, Geyer et al. 2000)
 4.23, 5.23 (*Daphna*: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.08, 6.04 (mussel: wet wt basis, dry wt basis, Geyer et al. 2000)
 4.63, 5.93 (goldfish: wet wt basis, dry wt basis, Geyer et al. 2000)
 4.67, 6.19 (zebrafish: wet wt basis, dry wt basis, Geyer et al. 2000)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.90, 4.80 (Lake Superior suspended sediment, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.31 (suspended particulates, Burkhard 1984)
- 5.5–6.3, 5.9; 6.80 (suspended sediment, average; algae > 50 μm , Oliver 1987a)
- 5.48 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
- 4.63 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
- 5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 4.51 (soil, calculated-QSPR Characteristic Root Index [CRI], Saçan & Balcioglu 1996)
- 5.10 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7\text{--}1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 7.2 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (1.0\text{--}2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation: 50–80% being degraded by *Alcaligenes* sp. strain Y-42 from lake sediments within 7-h period (Furukawa & Matsumura 1976; quoted, Pal et al. 1980).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 890 \text{ d}^{-1}$; $k_2 = 0.021 \text{ d}^{-1}$ (23°C, goldfish, 3% lipid content, Bruggeman et al. 1981; quoted, Waid 1986)

$k_2 = 0.0035 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 37.1 \text{ h}^{-1}$; $1/k_2 = 1142 \text{ h}$ (goldfish, quoted, Hawker & Connell 1985)

$\log k_1 = 2.95 \text{ d}^{-1}$; $\log 1/k_2 = 1.68 \text{ d}$ (fish, quoted, Connell & Hawker 1988; Thomann 1989)

$k_1 = 3950 \text{ d}^{-1}$; $k_2 = 0.0867 \text{ d}^{-1}$ (zebrafish, 30-d exposure, Fox et al. 1994)

$k_1 = 5044 \text{ h}^{-1}$, $k_2 = 0.411 \text{ h}^{-1}$ (algae *Chlorella fusca*, Wang et al. 1996)

$k_1 = 0.00447 \text{ h}^{-1}$; $k_2 = 0.100 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_1 = 14 \text{ L d}^{-1} \text{ g}^{-1} \text{ dry wt.}$; $k_2 = 0.129 \text{ d}^{-1}$ (Baltic Sea blue mussels, flow-through expt. Gustafsson et al. 1999)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 91 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 88 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from, $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2}$ = 196 d in rainbow trout, and $t_{1/2}$ = 81d in its muscle, (Niimi & Oliver 1983);

$t_{1/2}$ = 30 d in worms at 8°C (Oliver 1987c);

theoretical half-life to reach 90% steady-state tissue concn 5.4 d (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999);

$t_{1/2}$ = 6.9 h in blood plasma (ring doves, Drouillard & Norstrom 2000).

depuration $t_{1/2}$ = 91 d for high-dose treatment, $t_{1/2}$ = 88 d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.32 2,4',6-Trichlorobiphenyl (PCB-32)

Common Name: 2,4',6-Trichlorobiphenyl

Synonym: PCB-32, 2,4',6-trichloro-1,1'-biphenyl

Chemical Name: 2,4',6-trichlorobiphenyl

CAS Registry No: 38444-77-8

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

70 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.399 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.355, 0.182, 0.129, 0.0778 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.162 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0578 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.060 (GC-RI correlation, Burkhard et al. 1985b)

0.0543, 0.0562 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P/mmHg) = 16.10 - 4100/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0427, 0.0589 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -3935/(T/K) + 11.93$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

37.29 (calculated-P/C, Burkhard 1984)

41.75 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

20.27 (wetted-wall column-GC/ECD, Brunner et al. 1990)

39.69 (calculated-QSPR, Dunnivant et al. 1990)

27.3 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 42 \pm 6$ kJ/mol, $\Delta S_H = 0.10 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.60, 5.75 (RP-HPLC- k' correlation: uncorrected, with ortho correction, Rapaport & Eisenreich 1984)

5.80 (selected, Shiu & Mackay 1986)

4.95, 5.29, 5.21, 5.52 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

5.47 (generator column-GC, Larsen et al. 1992)

5.49 (recommended, Sangster 1993)

5.75 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations:

- 7.72 (fugacity meter/generator column-GC; Kömp & McLachlan 1997a)
 $\log K_{OA} = -6.50 + 4240/(T/K)$; temp range 10–43°C (fugacity meter, Kömp & McLachlan 1997a)
 8.89, 7.97; 7.92 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al 1999)
 7.49 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0107 (P_s from GC-RT correlation, Westcott & Bidleman 1981)

0.0133, 0.0160 (solid P_s , 25, $30^{\circ}C$, gas saturation-GC/ECD, Westcott et al. 1981)

$\log(P_s/mmHg) = 1.09 - 1510/(T/K)$, temp range $30-40^{\circ}C$ (gas saturation-GC/ECD, Westcott et al. 1981)

0.030 (P_L calculated from P_s using fugacity ratio F, Westcott et al. 1981)

0.0115 (GC-RI correlation, Burkhard et al. 1985a)

0.0243 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.0264, 0.0219 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0136, 0.030 (selected P_s , P_L , Shiu & Mackay 1986)

0.0119 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P_L/mmHg) = 10.40 - 4330/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0137; 0.0272 (quoted; calculated-UNIFAC, Banerjee et al. 1990)

0.0214, 0.0295 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/P_a) = -4075/(T/K) + 12.09$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)
 0.00484–0.0270; 0.0119–0.030 (quoted lit. P_S range; lit. P_L range, Delle Site 1997)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated):

15.20 (calculated, Murphy et al. 1983)
 16.92 (calculated-P/C, Burkhard et al. 1985b)
 43.67 (calculated-P/C, Shiu & Mackay 1986)
 22.70 (20°C , calculated-P/C, Murphy et al. 1987)
 21.99 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 16.21 (wetted wall column-GC/ECD, Brunner et al. 1990)
 24.31 (calculated-QSPR, Dunnivant et al. 1992)
 11.9 (11°C , gas stripping-GC/ECD, Bamford et al. 2002)
 29.2 (from 11°C exptl. data and compensation point, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 42 \pm 22 \text{ kJ/mol}$, $\Delta S_H = 0.11 \pm 0.08 \text{ kJ/mol-K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.48, 5.66, 5.98, 5.71 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.872 (slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 5.71 (recommended, Sangster 1993)
 5.87 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

9.52, 8.52 ($0, 20^\circ\text{C}$, multi-column GC- k' correlation; Zhang et al. 1999)
 8.03 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log \text{BCF}$:

3.79 (oyster, Vreeland 1974; quoted, Hawker & Connell 1986)
 3.79, 6.04 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.57, 5.87 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

4.80 (Lake Superior suspended solid, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

5.26 (suspended particulate matter, Burkhard 1984)
 4.64 (soil, calculated-S, Chou & Griffin 1986)
 5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 5.20 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.7\text{--}1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 14\text{--}30 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)
 $k_{OH}(\text{aq.}) = 7.2 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C , half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)
 $k_{OH}(\text{calc}) = (1.0\text{--}2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for trichlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 6.9\text{--}15 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 91 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 88 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for trichlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 1.90 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.88 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.37 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00413 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00099 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00052 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).

Biota: depuration $t_{1/2} = 91 \text{ d}$ for high-dose treatment, $t_{1/2} = 88 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.34 2,3',5'-Trichlorobiphenyl (PCB-34)

Common Name: 2,3',5'-Trichlorobiphenyl

Synonym: PCB-34, 2,3',5'-trichlorobiphenyl, 2,3',5'-trichloro-1,1'-biphenyl

Chemical Name: 2,3',5'-trichlorobiphenyl

CAS Registry No: 37680-68-5

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

58.0 (Burkhard et al. 1985b; Brodsky & Ballschmiter 1988)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.474 (mp at $58^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.319 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.129 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.162 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.205 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.036 (P_L supercooled liquid, Burkhard et al. 1985a)

0.0177 (GC-RI correlation, Burkhard et al. 1985b)

0.0447 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log (P_L/Pa) = -4075/(T/K) + 12.37$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

29.08 (calculated-P/C, Burkhard 1984)

51.17 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

42.73 (calculated-QSPR, Dunnivant et al. 1992)

29.0 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 41 \pm 4$ kJ/mol, $\Delta S_H = 0.10 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.51 (calculated-TSA, Burkhard 1984)

5.66 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

5.71 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988; recommended, Sangster 1993)

5.6522 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.72 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.31 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25-60$ d, due to gas-phase loss process at room temp. (Atkinson 1987)
 $k_{OH}(\text{aq.}) = 6.1 \times 10^9$ dm³ mol⁻¹ s⁻¹, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, 0.1–10 d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)
 $k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5-40$ d at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.0065 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 320 \text{ d}^{-1}$; $k_2 = 0.0065 \text{ d}^{-1}$ (rainbow trout, Oliver & Niimi 1985)

$\log 1/k_2 = 2.2, 2.9 \text{ h}$ (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b)

$k_2 = 0.006 \text{ d}^{-1}$ with $t_{1/2} = 107 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.006 \text{ d}^{-1}$ with $t_{1/2} = 112 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4$ –11 d in freshwater systems, $t_{1/2} = 0.1$ –10 d in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.20 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.95 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 1.36 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.39 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00155 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00285 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00258 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00119 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997)

Biota: half-life in rainbow trout, $t_{1/2} = 107 \text{ d}$ and $t_{1/2} = 61 \text{ d}$ its muscle (Niimi & Oliver 1983);

$t_{1/2} = 107 \text{ d}$ in rainbow trout (Oliver & Niimi 1985);

$t_{1/2} = 29 \text{ d}$ in worms at 8°C (Oliver 1987c).

depuration $t_{1/2} = 107 \text{ d}$ for high-dose treatment, $t_{1/2} = 112 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.41 2,2',3,4-Tetrachlorobiphenyl (PCB-41)

Common Name: 2,2',3,4-Tetrachlorobiphenyl

Synonym: PCB-41, 2,2',3,4-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4-tetrachlorobiphenyl

CAS Registry No: 52663-59-9

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

63 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.150 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985a)

0.0648 ($20^{\circ}C$, supercooled liquid S_L , Murphy et al. 1987)

0.0306, 0.0328, 0.0197, 0.0351 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.116 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0124 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0131 (GC-RI correlation, Burkhard et al. 1985b)

0.0110, 0.0098 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

4.59×10^{-3} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.0776, 0.0120 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4229/(T/K) + 12.22$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

23.91 (calculated-P/C, Burkhard et al. 1984)

20.37 (calculated-P/C, Murphy et al. 1987)

20.87 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

14.19 (wetted-wall column-GC, Brunner et al. 1990; quoted, Achman et al. 1993)

24.76 (calculated-QSPR, Dunnivant et al. 1992)

35.0 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 2\ kJ/mol$, $\Delta S_H = 0.05 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.09, 6.11 (RP-HPLC- k' correlation: uncorrected, with ortho correction, Rapaport & Eisenreich 1984)

5.73, 5.83, 5.82, 5.78 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

5.79 (recommended, Sangster 1993)

6.11 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

9.79, 8.82 (0, 20°C, RP-HPLC-RT, Zhang et al. 1999)

8.46 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

5.80, 4.80 (Lake Superior suspended solid, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

5.59 (suspended particulate matter, Burkhard 1984)

5.01 (soil, calculated-QSPR Characteristic Root Index CRI, Saçan & Balcioglu 1996)

5.40 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 6.4 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, 0.1–10 d in cloud water, > 1000 d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 147 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 162 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991)

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 147 \text{ d}$ for high-dose treatment, $t_{1/2} = 162 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.42 2,2',3,4'-Tetrachlorobiphenyl (PCB-42)

Common Name: 2,2',3,4'-Tetrachlorobiphenyl

Synonym: PCB-42, 2,2',3,4'-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4'-tetrachlorobiphenyl

CAS Registry No: 36559-22-5

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

69.0 (Burkhard et al. 1985; Brodsky & Ballschmiter 1988)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.370 (mp at $69^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.150 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985a)

0.0608 ($20^{\circ}C$, supercooled liquid S_L , Murphy et al. 1987)

0.032 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.0923 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.0334 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0131 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00507 (GC-RI correlation, Burkhard et al. 1985b)

0.0116, 0.0116 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

4.19×10^{-3} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

$\log(P/mmHg) = 10.70 - 4480/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.00912, 0.0135 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4229/(T/K) + 12.25$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

29.49 (calculated-P/C, Burkhard et al. 1985a)

32.02 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

14.19 (wetted-wall column-GC, Brunner et al. 1990)

25.92 (calculated-QSPR, Dunnivant et al. 1995)

10.13 (calculated-QSPR, Achman et al. 1993)

21.4 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

38.0 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 26 \pm 3$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.84 (calculated-TSA, Burkhard 1984)

5.76 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

5.72 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

5.72 (quoted values; recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.19 (10°C, estimated, Thomas et al. 1998)
- 8.27 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.64 (suspended particulate matter, Burkhard 1984)
- 5.30 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25-60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5-40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.006 \text{ d}^{-1}$ with $t_{1/2} = 123 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 140 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.20 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.89 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 1.23 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.35 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00066 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00309 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.0016 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00101 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997)

Biota: depuration $t_{1/2} = 123 \text{ d}$ for high-dose treatment, $t_{1/2} = 140 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

$\ln K_{AW} = 5.8937 - 3103.2/(T/K)$; temp range 4 – $31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(25.8/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.049/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)—see Comment by Goss et al. 2004
 27.0 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 26 \pm 2 \text{ kJ/mol}$, $\Delta S_H = 0.05 \pm 0.01 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.67 (calculated-fragment const., Yalkowsky et al. 1983)
 5.84 (calculated-TSA, Burkhard 1984)
 5.81 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
 5.29 (calculated-S, Chou & Griffin 1986)
 5.61, 5.78, 5.74, 5.79 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.75 (calculated-TSA, Hawker & Connell 1988b)
 5.88 (calculated-MCI χ , Patil 1991)
 5.73 (recommended, Sangster 1993)
 5.81 (recommended, Hansch et al. 1995)
 6.20, 4.79–6.67 (calculated-Characteristic Root Index [CRI]; minimum-maximum range, Saçan & Inel 1995)
 5.6625 (calculated-molecular properties MNDO-AM1 method, Makino 1998)
 6.26 (calculated-CLOGP ver. 4, Ran et al. 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations:

8.36 (fugacity meter/generator column-GC; Kömp & McLachlan 1997a)
 $\log K_{OA} = -6.20 + 4340/(T/K)$; (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
 9.19 (10°C, estimated, Thomas et al. 1998)
 9.67, 8.71; 8.41 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 8.58 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

4.04 (oyster, Vreeland 1974)
 4.84; 6.37 (zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)
 4.04, 6.29 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.84, 5.37 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

5.60, 4.70 (Lake Superior suspended solid, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

5.64 (suspended particulate matter, Burkhard 1984)
 4.43 (soil, calculated-S, Chou & Griffin 1986)
 5.60 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
 4.67 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
 5.05 (soil, calculated-QSPR Characteristic Root Index [CRI], Saçan & Balcioglu 1996)
 5.40 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{aq.}) = 5.5 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from ~4–11 d in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{\text{OH}}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation: 99% degradation at 24 h in one of the PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 200 \text{ d}^{-1}$; $k_2 = .0461 \text{ d}^{-1}$ (Zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.014 \text{ d}^{-1}$ with $t_{1/2} = 49 \text{ d}$ and $k_2 = 0.018 \text{ d}^{-1}$ with $t_{1/2} = 38 \text{ d}$ for food concn of 18 ng/g and 129 ng/g, respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 146 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 175 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.23 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.98 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 1.32 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.38 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are; $k = 0.00090 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00253 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00161 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00122 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997)

Biota: depuration $t_{1/2} = 38\text{--}49 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 146 \text{ d}$ for high-dose treatment, $t_{1/2} = 175 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.45 2,2',3,6-Tetrachlorobiphenyl (PCB-45)

Common Name: 2,2',3,6-Tetrachlorobiphenyl

Synonym: PCB-45, 2,2',3,6-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',3,6-tetrachlorobiphenyl

CAS Registry No: 70362-45-7

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

42 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.115 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.146 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.292 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0398 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0416 (GC-RI correlation, Burkhard et al. 1985b)

0.0226, 0.0268 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0295 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4117/(T/K) + 12.16$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

101.1 (calculated-P/C, Burkhard 1984)

31.92 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

35.95 (calculated-QSPR, Dunnivant et al. 1992)

12.47 (calculated-QSPR, Achman et al. 1993)

25.1 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

43.0 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 26 \pm 2$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.88 (calculated-TSA, Burkhard 1984)

5.53 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

4.84 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

4.84 (recommended, Sangster 1993)

5.4616 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.28 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

5.68 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

19.25 (wetted-wall column-GC/ECD, Brunner et al. 1990)

37.30 (calculated-QSPR, Dunnivant et al. 1992)

3.05, 8.91 (0, $15^{\circ}C$, from modified two-film exchange model, Hornbuckle et al. 1994)

12.67 (estimated-bond method, EPIWIN v3.04, Hardy 2002)

35.0 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 2\ kJ/mol$, $\Delta S_H = 0.05 \pm 0.01\ kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.68 (shake flask, Tulp & Hutzinger 1978)

5.20 (HPLC- k' correlation, McDuffie 1981)

- 6.29 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 6.17 (HPLC- k' correlation, De Kock & Lord 1987)
- 5.93, 6.04, 5.86, 5.94 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 5.94 (recommended, Sangster 1993)
- 6.29 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 9.55, 8.56 (0, 20°C, multi-column GC- k' correlation; Zhang et al. 1999)
- 8.01 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 3.98 (rainbow trout muscle, steady state, Branson et al. 1975; quoted, Waid 1986)
- 4.09 (rainbow trout, Neely et al. 1974)
- 3.95 (rainbow trout, Branson et al. 1975)
- 4.85; 4.782, 4.717 (quoted-whole fish; calculated-molecular connectivity indices, K_{OW} , Lu et al. 1999)
- 2.97, 2.71 (phytoplankton *Nanochloropsis oculata*, PCB concn at 50 ppb, after 4-d culture, Wang et al. 1998)
- 2.19, 2.11 (phytoplankton *Isochrysis galbana*, PCB concn at 500 ppb, after 4-d culture, Wang et al. 1998)
- 4.00, 5.52 (rainbow trout 8–10 g, muscle 3% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 4.46, 5.56 (rainbow trout 10–15 g, whole fish: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 4.76 (estimated-EPIWIN v3.04, Hardy 2002)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.30, 4.70 (Lake Superior suspended solid, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.61 (soil, calculated-solubility, Kenaga 1980)
- 5.72 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 4.68 (soil, calculated-S, Chou & Griffin 1986)
- 5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 5.04 (soil, calculated-QSPR Characteristic Root Index CRI, Saçan & Balcioglu 1996)
- 5.70 (soil, calculated- K_{OW} , Girvin & Scott 1997)
- 4.65 (estimated-EPIWIN v3.04, Hardy 2002)

Sorption Partition Coefficient, $\log K_p$:

- 5.0 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 5.18–5.64 (field-generated particulates, New Bedford Harbor, Bergen et al. 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 0.2921$ d from river, $t_{1/2} = 9.256$ d from lake (estimated-EPIWIN v3.04, Hardy 2002).

Photolysis: photolysis rate $k_p = 0.553$ d⁻¹ with $t_{1/2} = 13$ d in summer sunlight; $k_p(\text{exptl}) = 6 \times 10^{-8}$ d⁻¹ with $t_{1/2} = 133$ d, and $k_p(\text{calc}) = 2.2 \times 10^{-8}$ d⁻¹ in winter sunlight, at 40°L in surface waters (Dulin et al. 1986)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25-60$ d, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 6.4 \times 10^9$ dm³ mol⁻¹ s⁻¹, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4-11$ d in freshwater systems, $t_{1/2} = 0.1-10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5-0$ d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: no degradation observed after 98 d incubation by river dieaway test (Bailey et al. 1983).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 286 \text{ d}^{-1}$; $k_2 = 0.030 \text{ d}^{-1}$ (10–12°C, rainbow trout muscle, Branson et al. 1975; quoted, Waid 1986)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 160 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 177 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radical for trichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 49.2 \text{ d}$ in Lake Michigan (Neely 1983);

photolysis $t_{1/2} = 13 \text{ d}$ in summer sunlight and $t_{1/2} = 170 \text{ d}$ in winter sunlight at 40°L in surface waters (Dulin et al. 1986);

half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991);

half-life of volatilization: $t_{1/2} = 0.2021 \text{ d}$ from river, and $t_{1/2} = 9.156 \text{ d}$ from lake, (estimated-EPIWIN v3.04, Hardy 2002).

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 28 \text{ d}$ in rainbow trout muscle (Branson et al. 1975; selected, Waid 1986).

depuration $t_{1/2} = 160 \text{ d}$ for high-dose treatment, $t_{1/2} = 177 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.48 2,2',4,5-Tetrachlorobiphenyl (PCB-48)

Common Name: 2,2',4,5-Tetrachlorobiphenyl

Synonym: PCB-48, 2,2',4,5-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',4,5-tetrachlorobiphenyl

CAS Registry No: 70362-47-9

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

65.9 (Miller et al. 1984; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.4 (Miller et al. 1984; Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

69.04 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$, F:

0.393 (calculated-assuming $\Delta S_{fus} = 56\ J/mol\ K$, Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.121 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

0.030 (supercooled liquid S_L , Murphy et al. 1987)

0.0328, 0.0376, 0.0467, 0.0452 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0923 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.0222, 0.0596 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0167 (supercooled liquid P_L , GC-RT correlation, Burkhard et al. 1985a)

0.0177 (ΔG_v and GC- k' correlation, Burkhard et al. 1985b)

0.0157, 0.016 (supercooled P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0265 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.0115, 0.0170 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4229/(T/K) + 12.37$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

0.010 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI; Saçan & Balcioglu 1998)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

42.71 (calculated-P/C, Burkhard et al. 1985b)

26.64 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)

30.67 (calculated-QSPR, Dunnivant et al. 1992)

19.30 (calculated-QSPR, Achman et al. 1993)

3.05, 8.91 (0, $15^{\circ}C$, from modified two-film exchange model, Hornbuckle et al. 1994)

22.8 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

39.8 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 25 \pm 2\ kJ/mol$, $\Delta S_H = 0.05 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 5.86 (calculated-TSA, Burkhard 1984)
- 5.78 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
- 5.71, 5.79, 5.56 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 5.95 (calculated-solvatochromic parameters and intrinsic molar volume V_i , Kamlet et al. 1988)
- 5.69 (recommended, Sangster 1993)
- 5.9108 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 9.49, 8.50 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
- 8.57 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 4.41, 5.71 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.66 (suspended particulate matter, Burkhard 1984)
- 5.80 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25-60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)
